PREFACE.

The following treatise on Vocabulary Studies was prepared, in the main, as a partial requirement for the degree of Master of Arts at Colorado College, and was submitted for approval in June, 1915. Since that date there have appeared several articles bearing upon the subject; likewise certain additional minor investigations have been conducted by the writer. Comment upon these articles and investigations appears from time to time in this treatise in the form of inter-paragraphical notes. It has been the writer's purpose to bring this discussion on vocabularies up to date.

The parenthetical numbers refer to the bibliography at the end of the treatise. Thus (1) refers to reference number 1, that is, Babbitt, E. H.; Pop. Sci. Mo.; Apr. 1907; 70; 378; A Vocabulary Test.

The experiments undertaken by the writer were, for the most part, conducted during the spring months of 1915. They were carried on under the general direction of the Department of Psychology and Education at Colorado College, Colorado Springs, Colo. The subjects tested were, with a few exceptions, students of Colorado College or of the Colorado Springs High School.

PART I.

INTRODUCTION.

A word represents an idea. The nature of a man's ideas determines the nature of his words. The mind of a man, the mind of a people, is reflected in the language of the man, the language of the people. Good words are begotten by good thoughts; evil words arise from evil thoughts. The source of an idea is at the same time the source of the word to express that idea. Thought and language are inseparable. As a man's character is, such is the nature of his true vocabulary.

An idea is represented by a word; a group or combination of ideas is represented by a group or combination of words. The larger a man's vocabulary, the greater the number of his specific ideas. He who has an immense vocabulary not only has a great number of specific ideas, but also has the possibilities of an enormous number of combinations of words—that is, combinations of ideas. Similarly, for him who has a small vocabulary the number of possible combinations of ideas is reduced to a minimum. This faculty for the combination or grouping of ideas may be called general intelligence. Clearly, the vocabulary furnishes us the best basis for the measurement of general intelligence.

The child, immediately upon entering the world, makes his presence known by a cry. This cry is merely a reflex act, induced by the new and strange conditions to which the vocal apparatus of the child

is suddenly and rudely subjected. But the cry soon becomes differentiated, assuming different proportions and varied intonations to express different mental states. Later, with the coming of definite ideas we find the entrance of words to express them. The crys and babblings assume a more articulate character. The child's vocabulary is being established.

Speech is not inherited. To some degree it is probably instinctive. The general neural paths favorable to the development of speech are formed in the embryonic stage. But the actual development of speech must begin after birth. Language arises with ideas. Why does the new-born child not talk? The psychological reason is that he is devoid of ideas. He really has nothing to say. There is also a physiological reason. Even though the child had ideas he could not express them vocally, for his speech-apparatus is as yet too imperfectly developed. Not only must the child acquire ideas, but he must also acquire the motor co-ordinations to express those ideas—those otherwise unspoken words. On the cortical surface of the brain, just over and slightly back of each temple, lies a small area known as the convolution of Broca and recognized by psychologists as the speech center. All about this convolution there is a series of highly complex motor centers which utilize secondary motor centers in the face, setting them to work in varying combinations. Next to the motor centers for the face, in the anterior-central gyre, we find the highly differentiated motor centers for the hand (37). Thus we find that the motor centers for the face and for the hand are closely related to those having to do with vocalization. Witness facial expression and the universal use of gestures. An idea, a word, may be expressed by means other than vocal.

Language has been defined by Broca as, "The faculty of establishing a constant relation between an idea and a sign" (36). Yocum says, "The number

and kind of words in a teacher's vocabulary largely determine his thinking by limiting or increasing the amount of experience which he will retain and the possibility of its being related to other experience" (63). The application of the thought expressed in this quotation need not, as is quite evident, be confined to teachers. Rankin makes the following statement: "Whether the relationship be that of cause to effect, of effect to cause, or of mixed cause and effect, the fact is very evident that broad scholarship, and even mere general culture, is always accompanied by the mastery of a wide vocabulary" (51). It is asserted by Tracy that "Thought itself cannot attain to any great degree of generality without the aid of language. Thought and language are mutually helpful, and conduce each to the development of the other" (57). And Beyer says, "It can not be doubted that thought and language are inseparable. It does not greatly matter whether one puts thought, the egg, or language, the hen, first. No language, that is, no symbols, no thought; vague, blunderbuss, generic symbols,—vague, blunderbuss, double-pointed thought; sharp, fine, distinct words, sharp, fine, distinct thought" (8). Additional statements of a similar nature might be quoted. But wherefore? A little introspection should be sufficient to convince anyone of the relation between idea and word—of the important connection vocabulary bears toward thought.

It is the writer's purpose in this brief treatise to confine himself almost wholly to the study of actual vocabularies, making certain observations concerning their growth and size, the relation between vocabularies and arbitrary grades as found in schools and colleges, age and sex influences, and the like. First the results attained by a number of other persons interested in this same line of work will be presented. Then will be shown the results of certain vocabulary experiments carried on by the writer, in conjunction with Dr. J. V. Breitwieser, at Colorado

College. This will be followed by comparisons, comments, and conclusions. And finally, as an appendix, will be found the actual vocabulary test as it was used in the Psychological Laboratories of Colorado College.

PART II.

GENERAL DISCUSSION.

In few fields of research do we find such a discrepancy of opinion as we find among the various guesses, estimates, and calculations in regard to the size of vocabularies. On the one hand eminent educators adhere to the belief that an average person has a vocabulary of only several hundred words, at best perhaps a thousand. On the other hand equally eminent educators assert that man has at his command any one of a hundred thousand words—or perhaps even twice that number. Why has there been such a difference of opinion, such a diversity of conclusions? Largely because there has been such a diversity of method in arriving at these conclusions. Many of the more or less absurd theories and opinions advanced by so-called “investigators” of vocabularies could scarcely have been reached by any other method save that of pure and exceedingly simple guesswork. Nevertheless we find that even those students of vocabularies who have gone about their investigations thoroughly and systematically arrive at conclusions not at all in harmony with each other. Perhaps such a state of affairs is to be expected. For as yet comparatively little of a definite nature has been done in the study of vocabularies. In view of this fact it is extremely difficult to make reliable generalizations, and to arrive at correspondingly trustworthy conclusions. It is regrettable that a subject of such wide-spread interest and such uni-

versal importance has been so neglected. Accurate measurements for physical power are common; accurate measurements for mental capacity are unknown. At best, measurements of intellect are but approximations. This, however, need not deter us in our efforts to discover something further to add to the meagre knowledge which we have concerning the human mind; it need not hinder us in our search for some system of measurement, however imperfect it may be, which will enable us to determine to even a slight degree the scope of human intellect. And when we consider the fact that even the most accurate physical measurements are relative, our problems concerning the intellect assume a less forbidding aspect. However meagre the attempt may be, it is surely worth while to make an honest effort to throw some light upon the subject—to aid in the unraveling of one thread of the great tangled skein.

Let us pause for a momentary inspection of a few of the highly interesting, though varyingly instructive, guesses and more or less haphazard estimates as to the number of words comprising a vocabulary. Then we shall review briefly a number of the actual vocabulary tests which have been made by various men and women.

To quote from Brown: "For the past two or three decades many books on the English language, English composition, and public speaking have 'estimated' the working-man's vocabulary at five or six hundred words, and the college student's at one thousand or twelve hundred. In a public address only a year ago an officer in one of our larger universities declared that 'the average senior' in that institution 'did not employ more than eight hundred or a thousand words in all the writing and speaking involved in the various activities of his life'" (13).

Dean Alvord, according to Rankin, stated that the working men of his acquaintance used scarcely two hundred words in all. Rankin is also authority for the statement made by a well-known American edu-

cational writer to the effect that a man may converse very well with a vocabulary of only seventy-five words! Rankin offers the following comment: "Ridiculous as is such a statement, the ever-unscientific public gulps it down with avidity and sighs comfortably in the assurance that it has seventy-five usable ideas all tagged with their proper word-signs. It does not occur to the public—who prefer ideas and clothes both ready-to-wear—that the baby of eighteen months is usually in good command of more than seventy-five words, yet is not able to 'converse very well' " (51).

Max Muller is authority for the statement that an English clergyman declares the laborers in his parish did not use over three hundred words (45), while dean Farrar has stated that the English laborers carry on their conversation with not more than one hundred words (18). What a lively conversation it must be!

Doran claims to have formed the acquaintance of a parrot that could speak 59 words—four-fifths as many as are required, according to our noted "educational writer" whose name has been withheld, in order to "converse very well" (18). And, if we may believe Gardner, the anthropoid apes are not far behind; for according to his assertion apes have a vocabulary of 25 or 30 words (18). It is remarkable how little advanced beyond the simian stage certain persons rate the lower strata of human society.

A New York paper once made the assertion that the number of words actually needed to get along in business was 3,500 (18); while according to Beyer, "In a reputable magazine a few years ago the statement was made that three hundred words were enough to enable the average person to carry on all the business of life." Beyer is inclined to think that the "working dictionary" of a cultured person must comprise about 4,500 to 5,000 words (8).

Baird says the total number of words needed by a tourist in a foreign country is 650. This is intended to indicate merely the number of words actually needed to get along with (2).

George P. Marsh about forty years ago stated that few writers or speakers used as many as 10,000 words, ordinary persons using only about 3,000 or 4,000. He says that Shakespeare used only 15,000 words in his literature, while Milton used only 8,000 (40). These statements made by Marsh have been disproved by later writers. Dr. Edward S. Holden declares that Shakespeare used over 24,000 words, and Milton, in his poems alone, used 11,377 (27). Doran found in Milton's works 12,800 different words. He further claims that Cowper used 11,284 words and Shelley 15,957. In Tennyson's works he found a total of 10,574 words, excluding all proper names not found in the dictionary. Only a few of Tennyson's minor poems and only a few of his translations are included in the Concordance from which this calculation is made (18).

In the French, so Dr. Edwin S. Du Poncot asserts, Victor Hugo used in *Notre Dame* 27,000 words; Du Poncot estimates that in all of his works Hugo must have used 38,000 different words (18). It is said that Victor Hugo actually created as many as fifteen hundred new forms of expression (54).

Several authors agree that the vocabularies of intelligent, cultured people, especially those of literary taste, contain from 25,000 to 30,000 words (18). Professor E. A. Kirkpatrick says that for ordinary reading one needs from 6,000 to 10,000 words. He estimates that a citizen of the United States having a common school education would know about 10,000 words, and a well-read college graduate and those who have pursued a university course would know from 20,000 to 100,000 (35). These theories advanced by Kirkpatrick almost a quarter of a century ago have been partially confirmed by actual

vocabulary tests conducted by him in more recent years (33).

We are somewhat prone to believe that foreign languages, even the most modern, have a much smaller number of words than are to be found in the English. Dr. R. J. Kellogg, however, is of the opinion that the vocabularies of such languages as the French, German and Spanish are practically as large as that of the English. There is scarcely a word in the English that does not have its equivalent in those languages, and almost every thought of an Englishman may be expressed by a Frenchman, a German, or a Spaniard (18).

There is also a general belief that the number of words in the language of a primitive people is very small. The vocabulary of an aborigine is supposed to be remarkable chiefly for its meagerness, verging to non-entity. Chamberlain, however, furnishes us with data relating to the number of words in use among various Indian tribes. This data is based upon dictionaries of the Indian languages. The total number of words in each of the various tribal languages considered varies from 10,000 to 40,000, the average being well over 20,000 (14). These estimates are probably too low, for the dictionaries were very incomplete. About eight or ten tribal languages were considered. A. G. Morice in his studies of the Dene languages says the Carrier tribe's vocabulary contains 150,000 verbal terms (44). It might likewise be well to note that in the Chinese language, which has a separate sign for each word, the total number of characters is usually estimated at about 25,000; however, considering as totally different those characters to which a stress mark gives a different meaning, other estimates place the number at 260,000 (42).

Estimates of child vocabularies present as interesting a disagreement as do those for the vocabulary of an adult. The average person, says Beyer,

guesses a two-year-old child's vocabulary to be about fifty words. Many claim that it does not exceed twenty-five; while a few persons are generous enough to give the child credit for knowing two hundred words at two years of age(8). Whipple once asked two of his friends how many words an ordinary three-year-old boy could use. The first of his friends ventured to place his guess at 150; the other greeted this estimate with derision and declared that fifty words would cover the vocabulary of any three-year-old child(60). Laurie, based on the authority of Max Muller, claims, in his "Lectures on Language and Linguistic Methods", that "In the child up to the eighth year the range of language is very small; he probably confines himself to not more than 150 words"(60). On the other hand we find Luckens reporting the assertion of Dr. Elmer Gates to the effect that his boy knew 11,000 words at the age of twenty-one months!(39).

It is evident that from such a wealth of diversity of opinion as has been presented thus far, little of a definite nature can be determined concerning the actual size of a vocabulary, whether it be the vocabulary of an adult or that of a child. In order to obtain adequate conclusions we must seek further than mere guesses, and estimates without foundation. Actual vocabulary tests, and studies in vocabularies, must be considered. In spite of the fact that these tests and studies produce widely differing results it may be possible, by conservative generalizations, to arrive at some comparatively trustworthy conclusions.

At what age does a human being begin to speak? Tracy tells of a child, a girl, who when only fifteen days old had a peculiar sort of cry for expressing her desire to be fed. In another case the feelings of hunger, cold, pain, joy, and desire were expressed by different sounds before the end of the fifth week (58). Professor Whipple claims that his son, Richard, said "Mamma" at the age of seven and a half

months; Whipple thinks, however, that this may have been mere accident (60). Dr. E. C. Hills says his daughter, Ruth, used six words when eight months of age (26). George C. Brandenburg in the study of his child found that the first word she pronounced with evident understanding was "Bye-bye" at ten months (11). Beyer, in commenting upon the language of his son, Thomas, claims that at the end of one year after birth the child's vocabulary "consisted of not more than 20 symbols, of which about 10 were English; the others, the language of infancy, more or less conventionalized in his own usage" (8).

The age at which speech begins varies in different individuals. In some, articulate language commences during the sixth or seventh month; others can not speak a single word when they are ten months or a year old. Girls usually learn to talk at an earlier age than do boys. Even after speech has begun its development varies greatly in different individuals; with some the progress is very rapid, while with others it is exceedingly slow. These are some of the explanations why tests of child vocabularies carried on by different people with different subjects so largely fail in conformity of results. It is also well to note that the number of individuals considered is too small to permit satisfactory generalizations and conclusions.

The following method used by Professor and Mrs. Guy Montrose Whipple in their study of the vocabulary of their three-year-old son will serve to illustrate a very practical manner in which the study of a child's vocabulary may be undertaken. This method, or one very similar to it, has been followed by a number of the most reliable contributors to this phase of vocabulary study. They proceeded thus: Twenty-six blank sheets, one for each letter of the alphabet, were prepared, and for ten days prior to the child's third birthday anniversary the words which he uttered were recorded. To this list were added

those words which it was known he had used previously, in each instance making sure that the words had not been forgotten by artificially producing an occasion for their use. Finally, a number of words were selected from several child's vocabularies that had been published. These words were similarly tested before they were added to the list. Plurals formed regularly were excluded; other inflected endings, grammatical variants and compounds, such as *tall*, *taller*, *tallest*, and *go*, *going*, *gone*, were included. Many students of child vocabularies do not include inflections as distinct words. Whipple makes the following comment: "It seems unnecessary to point out that, psychologically speaking, related forms like these are just as much distinct acquisitions for the child as are totally different words such as *tall* and *short*; the principles of exclusion that have been adopted by some compilers of children's vocabularies, notably Holden, may be grammatically, but they are not psychologically, justifiable" (60).

One of the most recent, as well as thorough, investigations in child vocabulary was the one carried on by Beyer, in the study of his son, Thomas Lynn Beyer, during the twenty-third and twenty-fourth months. Beyer used the same method as employed by Whipple (60), with the important exception that inflected forms were treated as distinct words only when there was a radical umlaut or internal change, as in *foot* and *feet*. Present participles were not included. Using this method, the child's vocabulary at two years of age was found to consist of 771 words. At the end of one year after birth, as has been previously mentioned, the child had command of about 20 symbols. At seventeen months this number had been increased to 160—an increase of 700 per cent in five months. At the end of two years his vocabulary amounted to 771 words, this being 38 times the number at one year, and almost five times the number at seventeen months. The

actual number of words learned from the seventeenth to the twenty-fourth months was more than four times as great as the number learned from the twelfth to the seventeenth. Beyer comments thus: "If he should merely maintain the same rate of increase during his third year, an eventuality altogether to be expected of a normal child in health, 1055 words will be added during the year, making a total of 1826, a number astonishingly close to the 1771 words actually recorded by Professor Whipple in the use of his three-year-old son. If it is true, as Professor Whipple says and as child-psychology regularly assumes, that the period between the second and third birthday witnesses the greatest expansion in thought-symbols, then we must place the probable limit much higher, possibly from 2200 to 2500. As a matter of fact, the first two weeks after the child's second anniversary, he learned about eighty words, an acceleration nearly twice as great as that of his former average; and during the 25th month, nearly two hundred, almost trebling the former rate" (8).*

Dr. E. C. Hills made a very thorough study of the speech of his daughter beginning on the second anniversary of her birthday and continuing his observations for a period of ten days. Only the words actually used by the child during that period were recorded. Some objects were pointed out and she was asked to tell their names, but in no case was a name given to her while the test was in progress. Furthermore, all the words used by the child during the period under consideration had been acquired by her without effort on the part of her parents, with the exception of the cardinal numerals from 1 to 10 and the names of some of the common colors. When eight months old the child had used six words, though, as might be expected, her pronunciation

*Later studies by Beyer have an important bearing on the above statements. Cf. page 26.

was imperfect. At two years of age, during the period under observation, she used a total of 321 words. Dr. Hills classifies the vocabulary as follows: proper nouns, 9; common nouns, 173; personal pronouns, 4; limiting adjectives, 26; descriptive adjectives, 23; verbs, 59; adverbs, 11; conjunction, 1; prepositions, 8; exclamations, 7. Of the 321 words used by the child, 228 were of one syllable; 76 of two syllables; one of four syllables; and 16 compound. Dr. Hills is of the opinion that the child used ten imperative sentences to one indicative sentence (26).

At the age of three the son of Professor and Mrs. Whipple had, according to the tests undertaken by his parents, a vocabulary of 1771 words. His first word had been pronounced at seven and a half months; four words were used at eleven and a half months; fifteen words constituted his vocabulary at the end of the first year. On his second birthday the attempt to record the words used by him was given up, for in the first fifteen minutes, when no one talked to him, he used 154 words, 98 of which were different. As is quite evident, vocabularies depend largely upon interest and environment. Thus we find that in this child's vocabulary, out of a total of 1771 words the number which had been acquired in connection with eating amounted to 215—over 12 per cent of the whole. The total vocabulary was classified thus: nouns, 993; verbs, 391; adjectives, 209; adverbs, 89; pronouns, 33; prepositions, 24; interjections, 24; conjunctions and articles, 8 (60).

According to Brandenburg, "The percentages of the different parts of speech (if one counts the verb forms printed in small capitals) in the dictionary are about as follows: nouns 48.4 per cent; verbs, 27.5 per cent; adjectives, 18.6 per cent; adverbs, 4.9 per cent; pronouns, .2 per cent; prepositions, .1 per cent; interjections, .1 per cent; conjunctions, .05 per cent" (11). These results were obtained

through the examination of several of the leading dictionaries.

Brandenburg found that at the age of three his daughter had a total vocabulary of 2282 words. Of the entire number, a trifle over 50 per cent were nouns. The vocabulary was divided into two parts, the first, containing 2099 words, being classified as the conscious vocabulary and the second, comprising 183 terms, being classified as the sub-conscious vocabulary. The latter classification was made up of words which the child had been known to use, but which had either been forgotten or could not be recalled because of lack of proper environment. Brandenburg found that of every eight nouns learned by the child, one was "pigeon-holed", or became a part of the sub-conscious vocabulary, while of the verbs only one out of every 33 was thus stored away. In one day the child used a total of 11,623 words, 859 of which were different. Thus, in one day she used 37.6 per cent of the total number of words at her command. Brandenburg not only lists the actual vocabulary of the child, but also publishes her entire conversation for one day. The total number of sentences used during the day amounted to 1873, the average number of words per sentence being six and a fraction (11).*

Mildred Langenbeck reports the investigation of an "unusually precocious child" who at the age of five had a vocabulary of 6837 words. It is said that when the child was three and a half years old her uncle taught her Herbert Spencer's definition of life,** and that though months often elapsed between her intervals of saying it she never forgot it.

*The above study by Brandenburg was later continued during the fourth year of the child's life. Cf. pages 26 and 27.

**"Life is a definite combination of heterogeneous changes, both simultaneous and successive, in correspondence with the external co-existences and sequences." *Herbert Spencer*.

The following incident is reported as having occurred when the child was aged four: once, becoming very angry at the dust, she exclaimed, "I should like to kill the dust." When asked how she could kill it she replied, "Very easily, pour a little water on it." A series of tests at the age of five conducted by the Binet-Simon method gave her a mentality as that of eleven years. She failed on questions depending upon teaching and experience, but excelled in those dealing with natural observation. She coined many words as occasion for their use arose. Many of the child's ancestors were distinguished men and women. On both sides her family were people of more than average capacity and cultivation. When sixteen months old the child had a vocabulary of 229 words. Of the 6837 words in her vocabulary at five years, 56.8 per cent were nouns (38).

The above reports of studies in child vocabularies will serve to illustrate the general nature and scope of such investigations. For the remainder of the studies of child language of which we have record a brief summary of the results obtained will be sufficient. For the most part, these results will be merely tabulated. A few of the studies, however, will bear more specific mention.

Viola Olerich, the "famous baby scholar," at two years knew 2,500 nouns according to actual records, and it was judged that she knew at least 500 more (47). Figuring on the basis that nouns amount to 60 per cent of the entire vocabulary of the child the total number of words known by Viola Olerich at the age of two would be 5,000.

Gale reports a boy of two and a half years to have used in one day a total of 9,290 words, 751 of which were different, and another child of just two years who used a total of 10,507, of which 803 were different (20). Sanford Bell found that his child of four years and nine months uttered a total of 14,996 words, while one of three and a half years used 15,230, in one day (7).

Tracy (58) found that in testing the vocabularies of a number of children, the total number of words considered being 5,400, nouns formed 60 per cent of the entire vocabulary. Other authors agree that the number of nouns in a child's vocabulary always exceeds 50 per cent of the total number of words.

Kirkpatrick makes the assertion that the number of words used by a two-year-old child varies from a few to a thousand. The average he believes to be about 200 to 400 (34). In close agreement to this assertion is the following statement by Whipple: "In the twenty-odd published vocabularies, we find that children from 16 to 19 months are using from 60 to 232 words, that two-year-old children are using from 115 to 1227 words, and that the vocabulary increases rapidly from that time on. It is perfectly safe to assert that the average three-year-old child makes use of 1,000 words. This holds true at least for the child who has an ordinary quantum of curiosity and a normal tendency toward linguistic imitation and who is in daily contact with parents or older children who are ready to name situations for him as fast as they appear" (56).

In order to facilitate the study of child vocabularies the following tabulation has been prepared:

TABLE I.

Child Vocabularies.

Authority.	Age of Child.	Vocabulary.	Reference.
Whipple	7.5 m.	1	60
Hills	8 m.	6	26
Tracy	9 m.	9	58
Whipple	11.5 m.	4	60

Nice	4 y.	1870	46
Doran	5 y.	1400	18
Langenbeck	5 y.	6837	38

Table I presents the size of various child vocabularies, the subjects ranging in age from 7.5 months to 5 years, and the vocabularies ranging in size from one word to 6837. Owing to the difference in age at which speech first appears, an attempted generalization in regard to the size of vocabulary before the age of two is not justifiable. Even at the age of two there is necessarily a great divergence in the size of the vocabulary. This is due partly to the fact that different children begin to talk at different ages; it is also due to the fact that children are not endowed with equivalent intellects, and some learn much more rapidly than others. Obviously this state of affairs continues throughout life. Therefore, in any group of considerable size, composed of persons of the same age selected at random, regardless of what that age may be, we can not expect a very close agreement in the sizes of their vocabularies. In actual number of words the variation at the age of two is doubtless smaller than at any subsequent age; for variation in terms of percentage of the entire vocabulary the reverse is probably true.

Omitting as very unusual the five thousand word vocabulary of Viola Olerich, we find the average vocabulary of the remaining sixteen two-year-old children recorded in Table I to consist of 454.56 words—approximately 450; the median is 398, and the mean variation 260.9. The range is from 36 to 1227. Unfortunately, the data at hand for the remaining ages of infancy is too slight to warrant the

reliability of generalization. Nevertheless, in the four vocabularies recorded for three-year-old children there is a certain general uniformity of size which may justify the taking of their average. The resultant is 1608.5—a number which seems very reasonable. Taking 1600 as the vocabulary at three years of age and 450 as that for two years, the increase in one year is 256 per cent; in other words, the vocabulary at three years should be, roughly speaking, about three and one-half times as large as at two years.

Note: Since the compilation of the foregoing table and statistics several magazine articles have appeared which have an important bearing on the subject. Beyer, who furnished such admirable data concerning the vocabulary of a two-year-old child, has continued his investigations during the third year and presents the results of this study in the *Educational Review*, Dec., 1916(9). It was found that the child, who at two years had a vocabulary of 771 words, acquired during his third year 1297 verbal symbols; thirteen of the words previously known had gradually been dropped, "the defunct language of infancy." This left a remainder of 2055. However, this estimate excludes about 200 "questionable words" which if added would bring the total to 2255. Using the more conservative estimate of 2055 as the vocabulary at three years, we find an increase of 166 % over the vocabulary at two years; if we take the larger number, 2255, the increase is 193 %. In either case the percentage of increase is considerably smaller than the suggested increase of 256 %. However, it should be noted that Beyer's child at two years of age had a much larger vocabulary than the average for the two-year-old child as ascertained from the table. It is not to be supposed that the child with a large vocabulary would show as great a yearly increase in terms of percentage, though in actual words his gain would probably be somewhat more than that of the child with a more meagre store of verbal symbols.

In an article in the *Pedagogical Seminary* for March, 1916, George C. and Julia Brandenburg give the results of a continuation in the vocabulary study of their daughter during the fourth year(12). At four years of age the child knew 3915 words, including regular variants except noun plurals; and 3061 words excluding all except irregular variants. At three years of age the child's vocabulary, including variants, totaled 2282; excluding variants, 2008. This gives an increase during the fourth year of 71 % in the former case, and 52 % in the latter.

At three years of age the variants constituted 12 % of the entire vocabulary; a year later they amounted to 21.8 %. A comparison between the third and fourth years in regard to parts of speech is shown in the following table:

	Regular variants incl'd				Regular variants excl'd			
	No. of words		Per cent		No. of words		Per cent	
Age	3	4	3	4	3	4	3	4
Nouns	1171	1728	51.3	44.1	1171	1728	58.0	56.4
Verbs	732	1510	32.0	38.6	465	716	23.0	23.4
Adjectives	198	427	8.7	10.9	191	374	9.8	12.2
Adverbs	98	150	4.3	3.8	98	144	4.9	4.7
Pronouns	36	43	1.6	1.1	36	42	1.8	1.3
Prepositions	20	24	.8	.6	20	24	1.0	.8
Interjections	15	19	.6	.5	15	19	.8	.6
Conjunctions	12	14	.5	.4	12	14	.6	.4
Total	2282	3915			2008	3061		

Brandenburg claims that from a study of 2000 school children of various grades he has ascertained that children in the public schools build up their vocabularies at the rate of approximately 1400 words per year, exclusive of variants. It would be of interest to know the increase rate inclusive of variants; and also to know the per cent of increase from year to year.

Bateman, in the June, 1916, issue of the Pedagogical Seminary, discusses the language of three children at the same age(5). All three children were girls, two, J. and A., being sisters and the other, D., a cousin. The appearance of the first word in the three cases was A., ten; J., ten and one half; and D., eleven months. The vocabularies at one year comprised D., 8; A., 9; and J., 10 words. Bateman cites eight cases of one-year vocabularies, the average number of words being 9. At two years one of the three children in consideration had a vocabulary of 497 words. At twenty-eight months the vocabularies excluding proper nouns and inflections, were: A., 628; J., 405; and D., 308. Including proper nouns and inflections, the vocabularies for the two sisters were: A., 779; and J., 488. Data concerning three other vocabularies at 28 months is given showing totals of 677 (cited in Table I of the present treatise), 451 and 345 words. The average for the six vocabularies at 28 months is 469. Bateman claims the average number of words at two years for 20 vocabularies is 498; at three years for 9 vocabularies 1,515. Authorities for these statistics are not cited. These averages for the two-year and three-year vocabularies show a remarkably close approximation to the averages obtained from Table I of the present discussion. If an average is attempted from the two groups of two-year and three-year

averages (the group cited by Bateman and the group presented in Table I), though such an average of averages would doubtless by no means be exact since there are probably repetitions in the two groups, the resultant gives a vocabulary of 479 words for the average two-year-old child, and a total of 1544 words for the three-year-old child; showing an increase of 222 % from the second to the third year. Is it then too much to say that during the third year the normal child may be expected to show a gain of from 200 to 250 per cent in vocabulary?

For the remainder of this part of the treatise which deals with investigations carried on by others in the field of vocabulary study, owing to the nature of the data at hand, recourse must be had very largely to broad generalizations. A few specific instances will be mentioned, for the most part without comment, and such generalizations as are deemed advisable will be presented.

Dr. Peter Roberts said the average vocabulary of a child of six or seven amounted to only 300 or 400 words(56). Other writers have made somewhat similar statements. In view of the data which has been presented concerning the vocabularies of children during infancy, and especially the conclusions reached in the case of the two year vocabularies, such statements as that of Dr. Roberts may be discarded without further consideration.

In connection with the study of children who are just entering school, and even in regard to those who are a little more advanced but still in the lower grades, it is interesting to note the number of different words used by some of the textbooks. The average primer comprises a vocabulary of between 300 and 400 words. A few contain approximately one thousand, but these are exceptional. Thus the six-year-old child, in order to qualify for promotion, must learn to recognize in print 300 or 400 words. This number obviously does not comprise his entire vocabulary—perhaps not even one tenth of it. For when the child is beginning to read and until he has mastered the system of alphabetical and syllabical

combinations to form words, he certainly is familiar with a comparatively enormous number of terms which he would fail to recognize in print.

Jean Sherwood Rankin found a total of 5,965 different words, including 909 proper names, in a popular and modern textbook in United States history (51). In order for the eighth-grader to study intelligently this particular book he must obviously know the great majority of these words. It should be born in mind that textbooks for different subjects all have, after a fashion, their own special vocabularies. Likewise we must remember that a considerable number of words which, even in their printed form, are familiar to the eighth-grader do not appear in any of his textbooks.

To quote from Katrina Koch: "Every educator knows, that by his fourteenth year the boy has learned, understood and remembered lists of words, varying from fifteen to twenty thousand. And of these, most teachers realize, to their chagrin, that they succeed in making him use not over eight hundred or a thousand" (36).

A study of the reading vocabulary of three children who had attended school one and a half years was undertaken by Myrtle Sholty. She took all the readers which the children had read since entering school and used the words of these readers as the basis of the vocabulary test. All the words which could be built up or worked out by sound were called phonetic words. Though the children had had daily drills in phonetics for twelve months, each one knew a greater number of sight than phonetic words, showing that they still depended very largely upon the memory. Of the three children, one, designated as A, was supposed to be the best reader, B medium, and C the poorest. Out of a total of 1,588 words known in context were: B, 1,438; A, 1,392; and C, 1,309. Results for words recognized when seen on the instant, that is through the tachistoscope, were:

C, 1,009; A, 977; and B, 798. The results for words worked out are given as: B, 670; A, 412; and C, 315. Thus C was the most dependent reader because she could build up fewer words, and B was the most independent. C is said to have improved rapidly and when the test was completed was the fastest reader of the three. A, who was supposed to be the best reader, ranked only second in each of the tests. It is interesting to compare the number of printed words known by these three children, who had attended school one and a half years, with the number of words which are, in general, found in a primer. Progress becomes more rapid as the child advances (53).

Doran reports a boy, nine years old, who had a vocabulary of 6,031 words. The boy was bright in many respects, but had not been to school very much. He was in the third grade. Doran's son, Edwin, at ten years of age could define at least 10,000 words, and when he was thirteen he could define 18,000, according to tests carried on by his father. The youth had read a great deal, and had had considerable practice in vocabulary work. At thirteen he had studied one year of Latin. Doran believes that Latin and Greek aid greatly in the enlargement of the English vocabulary (18).

Doran worked mainly with students in schools and colleges. His effort was to ascertain not the number of words that had actually been used in oral or written speech, but the number of words the persons knew or could use intelligently. In every case his results were attained by oral or written definitions. He included all proper names and variants found in the dictionaries which he used, saying, "As there seems to be some confusion in vocabulary tests as to what constitutes a word, let it be understood I have followed the dictionaries in this respect. I have counted what they have counted, and I have included what they have included." Some of his earlier investigations were based upon Webster's In-

ternational, the Academic, or the High-School editions, while his later studies were conducted by the use of the Century and the Standard dictionaries. His method was to select a number of words, usually 1,000 or more, taking all the words of each page, except such unusual words as no one would be likely to know, and selecting the pages either at random, or, as was more often the case, taking them in a certain definite order, as every twenty-fifth or every fiftieth page (18).

By class tests Doran found that the pupils of the sixth grade in one school averaged 4,192 words while in another they averaged 11,634; in the same two schools respectively the eighth-graders averaged 7,937 and 17,138. The pupils of the latter school were somewhat older than those of the former. For the most part, Doran's results will simply be tabulated in a general way further on in this treatise; and a few solitary tests which do not admit of adequate generalization will be given specific mention (18).

A certain Minnesota superintendent tested the vocabularies of four eighth-grade pupils by having them go through their small High-School dictionaries, counting word by word all that they felt sure they knew and might have used. Three of the four reported that they knew between nine and ten thousand words. The fourth estimated for himself nearly fifteen thousand. Jean Sherwood Rankin, in offering this report, comments thus: "These figures tally well with the reports upon vocabularies published by the one or two lone explorers in the field of high-school vocabularies, and lead us to the conclusion that the eighth-grade student who completes his work successfully must possess from ten to fifteen thousand words" (51).

Professor E. A. Kirkpatrick conducted a series of tests among children of the grades, as well as among high school and college students. His method is

clearly shown by the following quotation: "When a student began, say on page 2, and counted all the words in bold-faced type and the number of these known on every fiftieth page, and then did the same beginning with page 20, the results were so nearly the same as to convince me that the method was fairly accurate. Some preliminary tests were then made that showed that a hundred words taken by chance from various parts of the dictionary might serve as a fairly accurate measure of the size of one's understanding vocabulary The author now considers that the best list of words is obtained from Webster's Academic Dictionary (which contains about 28,000 words on 645 pages), by taking the first, second, or last word, or any other definite word on every sixth page. For general purposes and for all ages this is probably better than to take a hundred words from an unabridged dictionary which contains so many various and obsolete forms of the same words, along with rare words, and technical terms not found in the smaller dictionary. Estimates based on words from the academic dictionary give less than half as many words in the vocabulary as those based on data from the unabridged, but they are more representative of fundamentally different concepts.

"The method of using the test was to place the printed list before the subjects and ask them to mark the words that they knew with a plus (+) sign, those that they did not with a minus (—) sign, and doubtful ones with a question mark (?). The tests, which numbered about two thousand, were made chiefly upon pupils from the fourth grade up through the high school and university, although a few were made upon younger children. Control tests showed that if the same test was given orally, there was some difference in the words marked as known and unknown. This difference was of course very great in the second and third grades, where a few tests were made, and became less with age, yet

it usually amounted even in the case of adults to from one to three per cent. In a few individuals the difference was quite marked" (33).

Kirkpatrick found the individual differences in size of vocabulary to be very great, some ninth grade children falling to the rank of second grade children, while some in the third or fourth grades ranked with the average of those in the ninth grade or high school. In general, he found that those students who had read extensively ranked higher in size of vocabulary than those who had read little. He announces that in his own classes where students were ranged in three grades according to the number of words which they knew in one list, other lists of words similarly selected resulted in 60 per cent to 80 per cent of them being again in the same grade. None changed from the lowest to the highest of the three classifications (33). The results of Kirkpatrick's research will be tabulated later.

Another form of vocabulary test was that conducted by R. W. Brown. Six members of the freshman course in English at Wabash College were the subjects for this investigation. Each student carried small cards with him at all times and endeavored to catch all the words he used in ordinary speech and writing. The following classes of words were thrown out: all which were merely inflected forms of other words on the list; numbers, both cardinal and ordinal; pronouns and demonstratives; nouns used only as proper nouns; extremely technical terms; all except one word from each group of words obviously related in their origin; all negatives in *un* and *in* except where only the negative form of the word exists, or where the positive is rare; and finally, all words in *re* and *dis* where the meaning could be readily gathered from the definitions of the root word and the prefix. In spite of such strenuous efforts to avoid any possible over-estimation, the total number of words—we might almost say words entirely without relation to each other—in ordinary

use by each of the several students who performed the experiment was found to be: 2,970; 3,190; 3,920; 4,510; 4,550; and 4,560. The students varied in age from 17 to 21 years. Their class room records ranged from the highest to the lowest. The words themselves "represent all the variety of interest which one would expect to find in a group of young men who are beginning their college course" (13). Although this particular experiment is of little value as regards the total number of words in a vocabulary, nevertheless it is of interest in that it gives us some inkling as to the number of words in ordinary individual usage—a number unexpectedly large, especially when we consider the enormous number of words which were rejected in this test.

Another interesting test was that carried on by Barnes with six freshmen and four upperclassmen at De Pauw University. Without having given them any previous intimation as to what he desired of them, Barnes called these students into his office and told them to write down all the words they could think of in two hours. The results were: Freshmen, men, 1,114, 1,596, 1,789; women, 847, 948, 1,230. Upperclassmen, men, 1,239, 1,464; women, 1,489, 1,573. At the end of the two hours every student was still writing rapidly and insisted that he had by no means exhausted his supply. Many of the commonest words of every-day life had been omitted (4).

E. H. Babbitt employed a vocabulary test, a little different in detail, but essentially the same as Professor Kirkpatrick's, to find the number of German words which could be defined by students when they entered the second year's work in the subject at college. Some of these students were admitted on examination. It was found that the vocabulary of those who could pass such an examination was never less than 2,000 words, ranging from that to 5,000. The mark received on the entrance examination was

in close relation to the extent of the vocabulary. The test was repeated at the end of the year, the results showing that the vocabularies now ranged from 5,000 to 12,000. The marks on the final examination at the end of this year's course were also in close relation to the extent of the vocabulary. Babbitt tried this plan for several years, and always got comparatively uniform results(1).

Later, Babbitt extended his investigations to the English language. He used an unabridged dictionary containing over 100,000 words. The majority of the college sophomores upon whom he tried the experiment reported from 50,000 to 60,000 words. Babbitt claims that students who had not studied Greek regularly reported from 10,000 to 15,000 words less than those who had(1).

Thus we see that different investigators have carried on the study of vocabularies in various ways with varying results. For the sake of convenience the following tables have been prepared, showing generalizations in regard to the size of vocabulary of students ranging from the second grade to the college:

TABLE II.

Average Vocabulary of Students in the Grades.

A.

Investigations by Kirkpatrick(33).

Grade II	4480	Grade VI	8,700
Grade III	6620	Grade VII	10,660
Grade IV	7020	Grade VIII	12,000
Grade V	7860	Grade IX	13,400

B.

Investigations by Doran(18).

Grade VI	4,192	Grade VI	11,634
Grade VII	5,849	Grade VII	13,675
Grade VIII	7,937	Grade VIII	17,138
		Grade IX	18,865

TABLE III.

Average Vocabulary for High School Students.

Investigations by Kirkpatrick (33).

First year	15,640	Third year	17,600
Second year	16,020	Fourth year	18,720

TABLE IV.

*Average Vocabulary of Students
in the Normal School.*

A.

Investigations by Kirkpatrick (33).

Average for all years, Normal School	19,000
--------------------------------------	--------

B.

Investigations by Doran (18).

First year	11,700	Fourth year	19,400
Second year	15,400	Fifth year	21,500
Third year	15,750		

TABLE V.

Average Vocabulary of College Students.

A.

Investigations by Kirkpatrick (33).

Average for four years, College	20,120
---------------------------------	--------

B.

Investigations by Whipple (59).

Average for four years, College	20,512
---------------------------------	--------

C.

Investigations by Babbitt (1).

Sophomore Class, approximately 50,000 to 60,000

TABLE VI.

Average Vocabulary in Relation to Scholastic Status

Investigations by Kirkpatrick (33).

Scholastic Status	Vocabulary
Grade II	4,480
Grade III	6,620
Grade IV	7,020
Grade V	7,860
Grade VI	8,700
Grade VII	10,660
Grade VIII	12,000
Grade IX	13,400
High School, 1st year	15,640
High School, 2nd year	16,020
High School, 3rd year	17,600
High School, 4th year	18,720
Normal School, all years	19,000
College, all years	20,120

By reference to Table II it will be seen that Kirkpatrick's results for the sixth, seventh and eighth grades lie about midway between the two sets reported by Doran. The investigations by Doran of the students in the grades were conducted in two different schools, the first at Edmond, Oklahoma, and the second in a village school in Arkansas. It seems remarkable that such divergent results should have been obtained. Since the results obtained by Doran show, in general, a fairly close agreement to those reported by Kirkpatrick, and since the data at hand concerning the investigations of the latter is more complete, Table VI has been prepared, showing the average vocabulary in relation to scholastic status as ascertained by Kirkpatrick. This Table will again be referred to after the results of the experiments conducted at Colorado College have been presented.

It is well to note that Babbitt, whose results show the size of the college student's vocabulary to be about three times as great as is reported by Kirk-

patrick and Whipple, used a dictionary containing over 100,000 words, whereas the investigations of the other two were conducted by means of much smaller dictionaries. Further comment upon this matter will be made in Part IV.

Note: Since the compilation of the above statistics and tables there has appeared, in *School and Society*, Nov. 13, 1915, an article concerning vocabulary tests as measures of school efficiency(10). The Kirkpatrick list of one hundred words was used in testing the children of the upper five grades of Speyer School, the demonstration school of Teachers College, Columbia University. A second test was conducted with a similar list obtained from Webster's Elementary School Dictionary, which "includes over 44,000 entries, not including several thousand inflected forms." The Kirkpatrick list was selected from Webster's Academic Dictionary, which contains 28,000 words. The following table shows the results of these two series of tests:

Grade	Kirkpatrick List.		El. Dict. List.
	Kirkpatrick Group	Speyer Group	Speyer Group
4	7,020	10,886	-----
5	7,860	13,216	21,648
6	8,700	17,038	30,184
7	10,660	17,052	27,720
8	12,000	18,704	32,120

It was found in testing children in several neighboring schools that those of the Speyer School had a vocabulary from 10 to 25 per cent greater than those of the same grade in other schools. The difference is accounted for by the fact that the curriculum of the Speyer School is more intimately and vitally associated with every-day life and calls for more initiative on the part of the student than is the case in the usual elementary school curriculum.

Babbitt experimented with a number of people who had never been to college, but, with a common school education, were regular readers of books and periodicals. These people generally reported the size of their vocabulary to be from 25,000 to 35,000 words. Some went much higher, even as high as the lower figures for the college students which were tested by Babbitt(1).

Doran made a few individual tests among college students and others. These tests were, for the most

part, based upon the Century and the Standard dictionaries. Some of his reports are interesting to compare with the results of the other investigators.

He reports a girl in the second year academy who knew 23,100 words; another girl in the third year academy who knew 26,600; a man in the fourth year academy reports 41,895; while two men in college report 40,681 and 53,130 respectively (18).

Three boys, aged about thirteen years, had vocabularies of 22,722; 26,376; and 28,480 words each. A young lady 19 years old who had not quite finished the literary course in a young lady's seminary, apparently knew 20,537 words when tested by a comparatively small dictionary. With a large dictionary the result would doubtless have been much higher (18).

Doran, by a very extensive test, found that a certain young lady could define 92,161 words. He himself, almost twenty years ago, knew 84,000. A few years later, however, he estimated his vocabulary at 100,000 words. He knew thousands of words not in the dictionary, for instance technical and vernacular names in Zoology, Botany, and other sciences (18).

The experience of J. M. Greenwood is rather unique. He reports the following incident to have occurred during the first term he taught: "I had bought a second-hand copy of Webster's Academic Dictionary I took up Webster's Old Blue Book, and I marked down all the words between its two covers of whose meanings I had any doubts. There were sixty-eight of these words, and I hunted up their meanings in this dictionary. I had never looked into a dictionary of any kind a dozen times in my life before, and yet I was 'shakey' on only sixty-eight out of about 10,000 different words in that book" (18).

Edwin S. DuPoncot, having a knowledge of more than twenty languages, estimates his total vocabulary for the entire number to comprise 302,000

words (18). Babbitt estimates the total number of words which he knew in nine languages, including English, to be 285,000 (1). Table VII analyses the vocabularies of these two men.

TABLE VII.

*Vocabularies of the Same Individual
in Several Languages.*

A.

Total Vocabulary of Edwin S. DuPoncot (18).

English	70,000	Old High Ger.	5,000
French	50,000	Norwegian	3,000
German	45,000	Swedish	3,000
Spanish	35,000	Danish	3,000
Italian	25,000	Sanskrit	2,000
Latin	20,000	Anglo-Saxon	2,000
Portuguese	15,000	Hebrew	1,000
Old French	10,000	All others	3,000
Greek	10,000		
Total			302,000

B.

Total Vocabulary of E. H. Babbitt (1).

English	65,000	Latin	18,000
German	58,000	Spanish	16,000
Danish	52,000	Greek	13,000
French	30,000	Old Norse	11,000
Italian	22,000		
Total			285,000

The data at hand concerning the relation between the size of vocabulary and the class record of students is of too meagre and unreliable a nature for tabulation. Doran, as the result of his own observations, concluded that those who ranked high in their classes had a good vocabulary; and that those who had a good vocabulary ranked high in their classes. He comments thus: "It matters little whether we say students do well because they have

good vocabularies, or they have good vocabularies because they do well; it matters little which is cause or which effect—it follows that if you increase a student's vocabulary you increase his standing in his class. The one who has a vague, ill-defined knowledge of words, has vague and ill-defined thoughts, and is incapable of definite, systematic, and logical thinking. If a word is a sign of an idea, bungling, meaningless expressions indicate a clouded, vacant brain" (18).

Kirkpatrick found in general a tendency toward positive correlation between the size of vocabulary and class standing. In the case of individuals however, there was often a wide divergence between the class room marks and the vocabulary-index. In the grades there was no clear proof of the relationship. In one instance a number of freshmen were tested and the vocabulary index compared to the classroom marks. The average number of words known to the men who in general ranked above the average of their class in the various subjects was 5 per cent greater than for those ranking below the average. The women who ranked highest in English averaged nearly 4 per cent better in size of vocabulary than those who ranked lowest in English (33).

Whipple discovered a positive correlation between the vocabulary-index of a number of college students and their grades in his classes in educational psychology. He found that in general those students who had read the most books and magazines had the largest vocabularies (59).

It has been suggested by a number of men that a vocabulary test might be employed as an examination for college entrance. For example, Kirkpatrick says: "The question naturally arises whether size of vocabulary and ability to define and use words is not a sufficiently accurate measure of the intellectual ability of youths to justify the use of vocabulary tests in examinations for entrance to

college. College work is supposed to be general in its character, demanding general ability, of which the vocabulary test ought to give an indication. Of course if students should devote their time to a special study of the dictionary, the test would become special and valueless, since size of vocabulary would not then be an accompaniment and indication of experiences and intellectual advances, but of special study of modes of defining words in terms of other word symbols" (33).

As to sex influences upon the size of vocabulary we again find little except of a very general nature. Kirkpatrick is of the opinion that there is no constant difference between the sexes (33). Whipple did not feel that a positive sex difference had been established, though there was a suggestion of superiority of boys over girls, and of men over women (59). Doran thought it very probable that up to the fourth or fifth year girls knew or used more words than boys did. Among students he claims that in northern schools boys in the same classes and of the same age knew more words than did the girls, while in southern schools the reverse was true. He supposes this geographical influence to arise from the fact that the northern boy is more bold, aggressive and interrogatory than the northern girl or the southern boy; the southern girl is supposedly bolder and more aggressive than her sisters of the north and her brothers of the south. According to Doran, man should, in general, have the larger vocabulary because of his aggressive and inquisitive disposition (18).

Several authors agree that in infancy up to the fourth or fifth year the girl knows the most words. The boy learns to talk at a later age than the girl. For several years he is behind her in size of vocabulary, but at the age of five or six he takes the lead and retains it throughout the remainder of life. Thus, after the age of infancy the boy knows more

words than the girl, the man has command of a larger vocabulary than the woman (18).

The field of vocabulary study is a fertile one. The investigators in this line of work have been comparatively few. Their methods of conducting the research have been various. The results and conclusions are more or less inconsistent. Yet, when we group their results as a whole, we find that a great deal has been accomplished by these pioneers in the study of vocabularies.

PART III.

FALSE DEFINITION TEST.

The question has arisen as to the practicability of substituting a vocabulary test for examinations for college entrance, promotion, etc. Since a word is a sign of an idea, surely the more words one knows, the more ideas he possesses. The larger his vocabulary, the greater we would expect to find the scope of his general knowledge. If words indicate ideas and ideas indicate intelligence, why should we not simply employ a vocabulary test when the intellectual ability or status of an individual is to be ascertained? In the case of grading, or rating, students in the schools and colleges, could a vocabulary test be substituted, either wholly or partially, for the methods now in vogue? Is a vocabulary test a satisfactory substitute for examinations in determining the qualifications of an individual, either for admittance to a school or college or for advancement within or graduation from the school or college? Is there a correlation between grades or rank and the size of vocabulary? A satisfactory answer to these questions can be found only by the method of experimentation.

The fundamental purpose of the vocabulary tests which were conducted at Colorado College was to ascertain what relation, if any, the size of an individual's vocabulary bore to that individual's college rank and grades. A secondary purpose was to discover whether or not sex influences play an important part in the size of vocabularies. The attempt to deter-

mine the actual size of individual vocabularies was given less consideration, for reasons which will presently appear.

We have seen that different investigators have used different methods for the determination of size of vocabulary. For testing the vocabulary of infants the actual words used by the infant during a certain period of time may be recorded. For determining the size of an adult's vocabulary the individual to be tested may be asked to define each word in the dictionary with which he is familiar. Or he may be asked to define, or perhaps simply indicate, each word of a representative group of which he knows the meaning, the total vocabulary being estimated from the smaller group. Other methods for ascertaining the size of vocabularies have been employed, but these here mentioned, the one for testing infants and the other two for experimentation with adults, are probably the most noteworthy.

For the experiments conducted at Colorado College a new form of vocabulary test was devised. The plan was to select one thousand representative words and have each followed by four definitions, of which one was correct and the other three wrong. The position of the correct definition among the four was determined purely by chance, the order being based upon the results of a number of casts of dice. The subject was requested to check the correct definition of every word with which he was familiar.

The one thousand words were selected from the Funk & Wagnalls New Standard Dictionary, in which the space devoted to the vocabulary comprises 2757 pages; the method was to take the first word of the third column of every third page and of every thirtieth page. The object being, obviously, simply to obtain representatively distributed words. After the words were selected it was found that a large number of them were so unusual as to be, for the most part, unfamiliar to the average person. For

this reason the system of using four definitions, one correct and three wrong, for each word, as explained above, was applied to only six hundred of the words on the entire list; of the remaining four hundred, consisting of such terms as were considered unfamiliar to the average person, the subject was asked to define those words which he knew. This division of the entire list of one thousand words into two parts was done as a matter of convenience, both to the experimenter and to the subject, and for the sake of economy. The reason for employing a system whereby the subject checks the correct definition rather than a system in which the subject must actually furnish the definition himself is twofold: in the first place, definitions, whether written or oral, as given by students or others who are not specialists in philology are often of a very vague and hazy nature—so vague and hazy in fact that it is at times impossible to determine whether the subject really knows the word or not; in the second place, a person may be familiar with a word but because of lack of proper associations he may be unable to define it in terms of other word symbols. It was for the purpose of minimizing these difficulties that the system of four definitions was used. It is quite obvious that the difficulties above referred to would still be encountered in the list of four hundred words—those for which no definitions were furnished; however, these words were for the most part so unusual to the average person that the final results were vitiated very little by the fact that for this part of the list definitions were not furnished.

In preparing the list of words, biographical and geographical terms were omitted. Excluding these, the total number of words remaining in the dictionary used amounts to approximately 375,000. This number includes derivatives, compounds, homonyms, variants, obseletes, colloquialisms, etc. Owing to the manner of selecting the words used in the vocabulary test, and because of the dictionary ar-

rangement of main words and relatives or sub-words, the list of one thousand words is not a fair sample of the entire 375,000. However, it is safe to say that, at the lowest possible calculation, the list of words as used in the test is representative of not less than 250,000 vocabulary terms.

In recording the results the number of words having the correct definition checked was noted; from this, one third of the number of words wrongly checked was deducted, the theory being that according to the laws of probability the subject could, by pure chance, guess the correct definition for unfamiliar words once out of every four times; so that for every three which he had guessed wrongly the chances were in favor of his having guessed one correctly. To the number of words thus determined as known on the list of six hundred was added the number of words correctly defined on the list of four hundred. The result, that is, the total number of words considered as known on both lists, was called the vocabulary index. The vocabulary index multiplied by the number of words of which each word of the test is representative gives the total vocabulary. Thus, if we consider this test as representative of 250,000 words, in order to calculate the size of the total vocabulary the index must be multiplied by 250. Owing to the method of selecting the words, as explained above, the best we can hope for in the present test as regards the size of the entire vocabulary is a very rough approximation. But in using these figures the results can scarcely be too high. The minimum is used because of the fact that even the results as thus obtained in regard to the size of individual vocabularies are greatly in excess of those obtained by other investigators.

Whatever may be the faults and inadequacies of the system of vocabulary test that has just been described, *the test is at least relative*. It was not designed primarily as a means of determining the

size of an individual's total vocabulary, but rather for the investigation of such relationship as it was felt might exist between the size of vocabulary and grades or sex. It is the opinion of the writer that for this purpose the test is wholly adequate and practicable. A sample of the test sheets as actually used will be found in the appendix and may be referred to at any time.

In conducting the vocabulary experiments at Colorado College the subjects were obtained chiefly from classes in Psychology, Education, and English. In this way, strictly representative groups were secured, especially since the courses in Psychology and in English were required respectively of all Juniors and Freshmen. For tabulation the subjects were grouped according to college classification. The experiment was extended to include a number of high school seniors and freshmen. A few individuals other than college or high school students were also tested. Subjects were requested not to check words of which they were reasonably doubtful. They were warned that a certain deduction would be made for all wrongly marked. And yet, though many of the subjects thought the deduction would consist of as many words as they had wrongly checked, the average number of words incorrectly marked on each list of six hundred was almost fifty. This shows how predominant is the characteristic of tending to overestimate one's mental capacity.

The results of these experiments are to be found in Tables VIII to XXIV inclusive. The results are tabulated in regard to the size of the vocabulary index, being arranged in regularly descending order. Tables VIII to XIII inclusive show the words by classes without regard to sex. Tables XIV to XIX inclusive illustrate the sex influences. Tables XX and XXI show the results obtained from the experiments carried on with a few individuals not registered in college or high school. Table XXII pre-

sents the relation between vocabulary and major subject. Table XXIII offers generalizations in reference to sex differences, and Table XXIV presents calculations in regard to the total size of vocabularies.

In the tables the index number (Ind. No.) refers to the particular person, or "subject", under consideration. In other words, the index number is merely a substitute for the subject's name. The vocabulary index (V.I.) shows the number of words known in the total list of one thousand (after all corrections and deductions had been made). The average grade (Av. G.) has reference to the average grade or mark received by the individual for all his college or high school classes. The age is given in years and is only approximate. Sex is indicated by M. for male and F. for female.

College Juniors	86,925
College Seniors	94,075
High School, average*	71,450
College, average*	84,988

A glance at the tables is sufficient to convince the most skeptical that, taking the cases individually, there is no agreement worthy of note between the size of vocabulary and scholastic grades. In the case of the college seniors the individual who leads in the vocabulary list also has the highest grade. But the person ranking second in size of vocabulary falls below the average in respect to grades. Among

*Computed by class averages.

the juniors we find an individual with a grade of 91, which is exceptionally high, ranking far down on the scale in size of vocabulary. The sophomore leading the list has a grade of 77, which is below the average, while the freshman leading his class in vocabulary has an average grade of only 65. In brief, considering the cases individually, we are forced to the conclusion that there is absolutely no agreement adequate for practical purposes between the size of vocabulary and scholastic grades.

Nevertheless, in a very general way there is a certain agreement between size of vocabulary and grades. Thus, if we take the average vocabulary index for all the college seniors who rank above the average in scholastic grades and compare this with the vocabulary index for all those seniors ranking below the average in grades we find a difference of 50. The vocabulary indices are 403 for those above the average grade and 353 for those below. Treating the other college classes similarly the results show that in every instance the average vocabulary index for those students ranking above the average in scholastic grades is greater than that for those ranking below the average. The figures are, for the juniors, 355.2 and 342.2, giving a difference of 13; for the sophomores, 343.4 and 338.9, the difference being 4.5; and for the freshmen, 310.5 and 279.6, with a difference of 30.9. We may, therefore, make the assertion that in a very general way there is a positive correlation between size of vocabulary and scholastic grades.

Tables XIV to XIX inclusive show that, in general, the vocabulary of the male is somewhat larger than that of the female. This fact is shown more clearly in Table XXIII. In only one class, the high school seniors, does the average vocabulary for the female exceed that for the male. Taking the college classes only, the superiority of the male's vocabulary is quite marked. It is well to state here that, in the

opinion of the writer, the college students who acted as subjects for this vocabulary test were more representative than were the high school students. This was due to the manner in which these subjects were selected. Furthermore, in the college classes, with the exception of the seniors, the groups tested are much larger than in the high school classes. For this reason the data concerning the college students is probably more reliable than that concerning the high school students.

Tables XX and XXI, which present data concerning a number of people not entered in either the high school or the college, are offered merely for comparison, and as individual tests having to do with total size of vocabularies. The persons experimented upon were from various walks of life, some of them being college graduates and others having had only a common grade school education. Their ages are for the most part between 20 and 30. The number of persons is too few and the data concerning them too inadequate to furnish material for reliable conclusions. The persons are certainly not representative of the average type of individual. The majority of them are college graduates. Several, however, who have had no college education, perhaps not even a high school education, rank above the average of this group in size of vocabulary. And the average for this group is far above that for any other group considered.

According to the data presented in Table XXII, there is little, if any, relation between major subject and size of vocabulary. Apparently English majors are slightly above the average, though without more complete data we are not warranted in arriving at any trustworthy conclusions in this respect. As a matter of fact, among the seniors who were tested those majoring in English were not up to the average in respect to size of vocabulary. Only juniors are represented in Table XXII, the reason being

that for this class only was there sufficient data at hand for adequate tabulation concerning majors. The seniors were not selected due to the paucity of those tested. Table XXII should, however, probably suffice to show that major subjects furnish us with no means of judging reliably the relative size of vocabularies.

Note.— A great deal has been said, especially in recent years, concerning the value of Latin and Greek and the effects of these subjects upon the English vocabulary. As has been previously mentioned, the tests at Colorado College give us practically no reliable data on this phase of the subject. In the writer's opinion, however, the value of a study of the classics in connection with English has been somewhat universally overestimated. A few possibly go to the other extreme. Beyer says, "Ninety-nine and a half per cent of the words we speak and hear are native English" (9). Chamberlain claims that the modern English requires "a lexicon nearly fifty times as large as that which interprets all there is left of the prose and verse of her would-be Latin masters" (15). It is true that many of our words are based upon Latin and Greek roots, while a comparatively few have come to us with little or no change. However, it is well to bear in mind the fact that modern English words which are founded upon Latin or Greek bases have in many cases become so dissimilar to the originals that even the best student of the classics is unable to define them accurately simply by applying their former classical meaning. The writer has observed a number of highly ludicrous attempts at the definition of English words by use of the meaning of the Latin or Greek originals. Nevertheless, let us not lose sight of the fact that in general extensive knowledge of Latin and Greek roots, prefixes, and suffixes will prove to be an almost incalculable aid in certain lines of study, especially in a number of the sciences. It is in this realm that we may expect the closest approximation to the English definition by use of the original meaning. That the classics are a great aid to the scientist who wishes to form new words need not be questioned. For example, the chemist may desire to follow the German plan of including in one word an entire descriptive sentence, and as a result we have the following rather startling contribution: *tetramethyldiamidotriphenylmethane*. The psychologist desires to use a term expressing an unreasonable fear of losing one's position; not being able to find such a term in the dictionary, he has recourse to the classics and manufactures the word, *deempleophobia*; this word carries

with it the antonym expressive of the hobo's attitude toward work, *empleophobia*; similarly, as a counter-term to *empleomania* we may devise the expression, *deempleomania*. Thus the classics are called to aid when the approved vernacular is found to be inadequate.

The results offered in Table XXIV are computed on the basis that each word in the vocabulary test represents 250 words in the dictionary. According to these calculations the average college student is in command of 85,000 words, while the average high school student knows about 14,000 fewer terms. These results seem very much out of proportion when compared with the figures offered by other investigators. Additional comment upon this matter is to be found in Part IV of this treatise.

It is of interest to note the extremely wide variation in the size of individual vocabularies. For example, a number of college freshmen rank above the average senior in vocabulary index. Several high school freshmen rank higher than the lowest of the college seniors. One high school senior actually has at command, if the test is a reliable indicator, more words than any one of the college freshmen. The mean variation of a group demonstrates nicely the wide range of individuals within the group.

We have seen that there is no correlation, except in a very inadequately general way, between size of vocabulary and scholastic grades. Can we then adhere to the statement that words represent intelligence? Is theory overthrown by fact? Grades represent a certain kind of intelligence. If words also represent intelligence, and there is no correlation worthy of note between grades and size of vocabulary, how are we to explain this paradox? We find, furthermore, that, as a general rule, the vocabulary of the male is larger than that of the female. Is there any explanation for this phenomenon? Then, too, how are we to explain the great discrepancy which these tests which have just been described

bear toward the experiments of others in reference to the total size of vocabularies? These problems and others of a similar nature will be discussed in Part IV.

CONCLUSIONS.

PART IV.

As has been previously mentioned, we find in the field of vocabulary research a wide divergence of opinion. It is only by the generalization of data collected from various sources that one is able to arrive at trustworthy conclusions. Consideration must also be given to the methods employed by the investigators. Let us review briefly several of the most important of these methods.

In determining the vocabulary of an infant, doubtless the most satisfactory process is that of recording all the words used by the infant during a period, a month for instance; taking care that artificial occasions are produced for the use of such words as it is felt the child may know but has failed to use spontaneously. This method, or a variation of it, is the only one feasible for the study of the vocabulary of a very young child. It is obvious that the infant cannot define words in terms of other word symbols, nor can he recognize definitions of words in terms of other words. Hence the only adequate manner in which the vocabulary of the child up to the fifth or sixth year can be determined is to record the words actually used by him.

The method of recording the words actually used is of little value for investigations beyond the age of infancy. For after the child has reached the age

of five or six he knows a great number of words which he has no occasion to use in ordinary conversation. Therefore a different method must be employed for the calculation of his vocabulary. To the writer it seems that in order to record with even satisfactory approximation the child's vocabulary after he has passed the age of infancy, resort must be had to the dictionary. For the child in the lower grades a small dictionary, such as the Elementary School Edition of Webster's, should be efficient. The investigator should present the words, one at a time, to the child, asking him to define, or explain, each word with which he is familiar. Such words as it is felt the child does not know may be omitted from the test. Until the child has reached an age at which he is able to recognize in print practically all the words which he knows, the experiment must be conducted vocally, on the part of both the instructor and the child. A less accurate method than that of taking all the words in the dictionary is to take a representative list and calculate the total vocabulary from the number of words known in this list. The latter process is, except in the case of thorough individual tests, the most satisfactory, especially for older children and adults.

As the child grows older a larger dictionary should be used. For adults the largest dictionary available will give the most reliable results. For the older child and the adult the experiment may be conducted either orally or in writing or print. If the individual who is being tested is required to give definitions for the words, the final result will be the number of words which he can actually define. This might, for want of a better term, perhaps be called his absolute vocabulary. However, every person is more or less familiar with a number of words which he can not define but would recognize in context. These words, together with those which he can actually define, would constitute his understanding vo-

cabulary.* The term "practical vocabulary" may be applied to either of these two kinds of vocabularies—depending entirely upon the manner of considering the term. For the former, or absolute, vocabulary is practical in one sense—that of individual usage; while merely for the purpose of individual understanding, the latter vocabulary is to be considered practical.

For the estimation of an individual's absolute vocabulary the greatest difficulty to be encountered is in regard to the accuracy of his definitions. It is often extremely hard to judge by a person's definition of a word whether or not the meaning of the word is clear to him. The system of having the subject merely mark those words with which he is familiar is very unreliable and should not be used without an adequate means of checking the errors.

In order to estimate an individual's understanding vocabulary a system similar to that used by the writer will probably prove to be the most satisfactory. In this particular instance definitions were supplied for only a portion of the words. The remainder are so unusual, however, that even though suggestions had been offered few of the words would have been known to the average person. Furthermore, these words for which definitions were not supplied are for the most part of such a nature that in order to be able to understand them, except in a vague, general way, one must be able actually to define them.

Note: Certain preliminary investigations and observations lead the writer to believe that a reasonably adequate

*Dr. G. Stanley Hall apparently recognizes a very similar distinction: "He (the child) may live as a peasant, using, as Max Muller says many do, but a few hundred words during his lifetime, or he may need 8,000, like Milton, 15,000, like Shakespeare, 20,000 or 30,000, like Huxley, who commanded both literary and technical terms; while in understanding, which far outstrips use, a philologist may master perhaps 100,000 or 200,000 words" (23).

test for determining the size of an individual's vocabulary could be obtained by simply applying a thorough dictionary test of all the words beginning with the letter *c*; the result multiplied by 10 should give a fairly close approximation to the total vocabulary size.

It is the writer's hope at some future date to be able to present a scale of perhaps one thousand words, arranged in order of their difficulty, beginning with the simplest words of infancy and ending with the most complex words of maturity. The scale could be graded in terms of percentage or otherwise. In order to conduct a vocabulary test with this scale, the experimenter would merely determine at what position on the scale the individual tested could no longer give adequate definitions; it goes without saying that allowances would need to be made for isolated words, both known and unknown. A suggestive list somewhat of this sort is to be found in the appendix. Preliminary investigations with this list have been very encouraging.

Let us now review briefly the results of the tests which have to do with size of vocabulary in comparison to scholastic grades. Doran believed that those who ranked high in their classes had a good vocabulary, and that those who had a good vocabulary ranked high in their classes. Kirkpatrick found in general a tendency toward positive correlation between size of vocabulary and class records (33). Whipple arrived at similar conclusions (59). Kirkpatrick even suggests that vocabulary tests might be substituted for college entrance examinations (33). Babbitt actually employed a vocabulary test in connection with examination for entrance to, and graduation from, certain courses in German (1).

The results of the experiments conducted at Colorado College prove conclusively that the substitution of a vocabulary test for examinations to determine a person's qualifications in regard to scholastic status as recorded in the present system of grading would be absolutely futile. Individuals making very high grades are to be found near the bottom as well as at the top of the vocabulary scale. Other individuals whose grades are below the passing mark rank far above the average in size of vocabulary. Results of classes overlap, even through such a wide

range as that between the high school freshmen and the college seniors. Though there is a very general positive correlation between size of vocabulary and scholastic grades, the individual variations are too common and too great to permit conclusions to the effect that a person having a large vocabulary will make good grades, or vice versa.

How then are we to explain the paradoxical statement that vocabularies, as well as grades, are an indication of intellect? Since a word is the sign of an idea, and since ideas make for intellect, certainly the more words, and combinations of words, which an individual has at his command, the greater will be his range of intelligence. But this is general intelligence. Class grades are an indication of applied, or specific, intelligence. Herein we see the explanation for the lack of positive correlation between grades and size of vocabulary. Though both indicate intelligence, the intelligence in the one case is specific while in the other it is general. A person of comparatively low general intelligence may, by thorough application to the particular subjects under consideration, make most excellent grades. Whereas a person ranking high in general intelligence may encounter either a real or an imaginary obstacle in the way of his making high marks in the class room. In certain cases it may actually be impossible for a person of high intellect to apply his intelligence to the particular subject under consideration with sufficient specificity to rank high in that subject. Scholastic grades are an indication of the specific application of intelligence. This intelligence may be either general or specific in itself. Ordinarily we would expect the person with high general intelligence to be able to apply himself specifically with more effectiveness than the person with a low rate of general intelligence. This supposition is confirmed by the fact that in a very general way there is a positive correlation between size of vocabulary and grades.

In regard to sex influences, other investigators have furnished us with very little reliable data. Several authors agree that there seems to be a tendency toward a larger vocabulary for the man than for the woman. The boy, except in the case of infants, is thought to know more words than the girl. Among infants, it is generally agreed, the girl has the larger vocabulary. It is commonly known that girls usually learn to talk at an earlier age than do boys. Though data to prove these statements is lacking, we may doubtless accept them as reliable.*

According to the results presented in the tables of Part III the vocabulary for the male is, in general, larger than that for the female. In only one class test, that of the high school seniors, was the reverse true. Neither of the high school groups, owing to the manner of selection, is to be considered adequately representative. Considering the college students alone the preponderance of the male's vocabulary over that of the female is quite marked. We are justified in concluding that, in general, the man has a larger vocabulary than the woman.

The girl learns to talk at an earlier age than does the boy, and thus at the beginning has the lead in the race for vocabulary. The boy, however, after once acquiring speech, develops in linguistic powers more rapidly than the girl. He becomes of an inquisitive turn of mind, spends much of his time out of doors, comes into contact with more varied experiences than does his sister, and consequently becomes the possessor of a larger vocabulary. The girl is more quiet and reserved than the boy; she plays with dolls while her brother is, though necessarily in a small way, coming into contact with the outer world; the girl, being less inquisitive, consequently learns fewer general terms; her tendency is to concentrate on the things most closely related

*Whipple (59) and Hall (23) have both shown that there tends to be a superiority of range of information in the male.

to her. Thus, even in childhood we find a tendency on the part of the male to generalize, while the female specializes. This tendency is retained throughout life. Hence the male has the larger vocabulary, whereas the female apparently tends to make better scholastic grades.*

As was pointed out in Part II, there is a wide divergence in the results supplied by various investigators in regard to total size of vocabulary. Where the experiments have been carefully conducted the results show more uniformity than is at first obvious. Kirkpatrick(33) and Whipple (59), employing similar tests and basing their calculations upon dictionaries of the same size, obtain closely agreeing results. Babbitt(1), using a dictionary containing over 100,000 words, finds the average vocabulary of college sophomores to range from 50,000 to 60,000 words. When we consider that the dictionaries used by Kirkpatrick and Whipple contained less than 30,000 words the results obtained by Babbitt are no higher than is to be expected. The larger dictionary contains, in addition to a number of entirely different words, more forms of the same fundamental words. The almost inconceivably large vocabulary of an adult is due largely to the multiplicity of words formed from the same root.

In using a still larger dictionary than was used by Babbitt it is to be supposed the results would be considerably higher.** In the writer's opinion, the lowest possible estimation based upon the results of the tests conducted by him places the average college student's vocabulary at 85,000 words. This is doubtless far too low, as the figures are computed

*A somewhat similar explanation is given for the apparent preponderance in vocabulary size of the Speyer School children over those of other schools. Cf. page 38.

**Later data, concerning the tests conducted at Speyer School, validates the above statements admirably. Use of a larger dictionary almost doubled the apparent size of vocabulary of grade children(10). Cf. page 38.

upon the basis that the test represents only 250,000 words, whereas the dictionary, exclusive of proper names, contains about 375,000. It seems scarcely too much to say that, at the time of graduation, a college student should be in command of 100,000 words, the estimation having for its basis the dictionary vocabulary, exclusive of biographical and geographical terms. In addition to the 100,000 words, more or less, which constitute the individual's vocabulary as estimated, we must not lose sight of the fact that he knows countless words which do not appear in any dictionary. Thus there are thousands of familiar biographical and geographical names. The writer has taken no consideration of such terms in forming his estimations, for the reason that he believes it to be impossible to calculate with even vague approximation the total number of biographical and geographical words known to an individual. Biographical and geographical terms making for general intelligence vary for different persons and in different localities. Consider the immense number of purely local proper names known to every one in his particular locality which, for that individual and that locality, are an indication of general intelligence. Therefore, to the 100,000 word vocabulary let us add all the names of persons and places familiar to the individual; let us also add the names of characters of books; names of personified objects, as ships for instance; brands of goods; slang expressions and colloquialisms; and a host of other familiar terms which are not to be found in any dictionary—and the result is an indefinitely large, truly appalling, vocabulary. The number of words which an intelligent individual has at his command is simply terrific.

Note: It might be well here to suggest that perhaps at some future date statistics may be available to show the rate of vocabulary increase in terms of per cent from year to year. Unquestionably the greatest per cent of increase is to be found in the earlier years of a child's life. The average child should have a vocabulary of about 10 words at one year of

age. During the second year this number should be increased to 450 or 500, giving an increase of 4500 to 5000 per cent. The per cent of increase during the third year apparently has dropped to 200 or 250. Indications lead one to believe that during the fourth year the per cent of increase has fallen to about 75. The actual number of words gained each year, however, shows a distinct increase over the number gained during the previous year.* It is probable that this decrease in per cent of gain and increase in actual number of words gained continues through the period of distinct mental expansion of the individual—that is, until 25 or 30 years of age. It is also to be supposed that there will be a decrease in acceleration of both decrease of per cent of gain and increase of actual numerical gain from year to year. It seems, as may be ascertained from the tables in Part III of this discussion, that the per cent of gain from year to year during the high school and college period varies from 5 to 10; while the actual numerical gain yearly is probably in the neighborhood of three to five thousand words. This does not mean that during one year the individual will actually come into contact with and learn from three to five thousand new verbal terms; it means, rather, that he will have this remarkably large gain *in potentiality and not in actuality*. In a great many cases each new word learned carries with it *in potential* a number of other words founded upon the same root or symbol. As a homely example let us take the term "health"; at once we have the potentials of such words as: healthless, healthlessness, healthsome, healthsomeness, healthward, healthful, healthfully, healthfulness, healthy, healthily, healthiness, unhealthy, unhealthily, unhealthiness, unhealthful, unhealthfully, unhealthfulness, etc., *ad nauseam*. It will be seen that the acquisition of a new prefix or suffix will, in general, have an even more startling effect upon the size of vocabulary.

By a comparison of Table XXIV to Table VI it will be seen that the results obtained in the experiments at Colorado College are about four times as great as those obtained by Kirkpatrick for corresponding classes. Though Kirkpatrick's results show a very uniform increase in size of vocabulary from the second grade to the college, his figures are doubtless too low. A rough correction might be made by multiplying by four the figures which he presents for the high school, normal school, and college. Corrections for the vocabularies of the grade pupils should perhaps not be so great, though what

*Cf. pages 26 to 28.

this correction should be it is difficult to say without more complete data.

Note: Several months after the above was written an article, already referred to, (page 38), which describes the results of tests carried on at Speyer School appeared in *School and Society* (10). In these tests the use of a 44,000 word dictionary indicated an average vocabulary of 27,918 words for the children of the fifth, sixth, seventh and eighth grades. Kirkpatrick's average for the same grades is 9,805. In the light of this additional data, especially when it is considered that the Speyer results are probably too low rather than too high, it seems only reasonable that an approximate correction for the vocabularies of grade pupils as determined by Kirkpatrick could be obtained by multiplying his figures by 3 or 4.

In concluding this discussion on vocabularies it is scarcely necessary again to emphasize the important role which words play in our lives. A word may aptly be called an incarnate thought. Without words civilization would have been impossible. The power of words is incalculable. Their influence is illimitable. Their mysticism is entrancing.

A word is sufficient to lighten the burden of the weary, to uplift the depressed, to bring joy to the sorrowing; a word may blast the fondest hopes, and darken the brightest life. Words of love increase life's blessings, and words of hate augment life's curses. Words are sufficient to express the profoundest thoughts of the philosopher, or the simplest wants of the little child. Words convey the sublimist emotions of the poet, and the rudest impulses of the swain. A word may soothe the tumultuous mob and bring peace and happiness to the populace. A word may plunge nations—the entire world—into chaos. Words transport us from the present to the dimness of the fading ages of long ago, or whisk us in an instant to the beautifully dreamy times that are to be. A word erases the finite and replaces it with the Omnipotent.

APPENDIX.

LABORATORY TEST SHEET A.

In this list each word is followed by four definitions, of which ONE is correct. Check the correct definition of the words familiar to you. For every one incorrectly marked a deduction will be made from those correctly marked.

Aabec

- (a) A boat used by the natives of the Kongo region.
- (b) An ape-like animal of South America.
- (c) An Australian medicinal bark said to promote perspiration.
- (d) A short spear used by the Eskimos.

Absolute

- (a) Not solvent.
- (b) To acquit or pardon.
- (c) Complete in itself.
- (d) Not present.

Accidental

- (a) Without hesitation.
- (b) Being shortened.
- (c) Refraining from excess.
- (d) Happening by chance.

Actio

- (a) The action of radium rays.
- (b) A public, written declaration.
- (c) An invoice of merchandise for court purposes.
- (d) A right enforceable by law.

Addressee

- (a) One who is addressed.
- (b) One who addresses another.
- (c) That portion of a name and address which pertains to the person alone.
- (d) A small rat-like animal of Australia.

Adjust

- (a) An Italian fisherman.
- (b) Charge on oath.
- (c) To cause to fit.
- (d) To scrutinize.

Adroit

- (a) Dexterous.
- (b) Awkward.
- (c) A fundamental tone into which others blend.
- (d) Without regard to rules and regulations.

Affect

- (a) Belongings.
- (b) State or condition.
- (c) Unseemly.
- (d) One who pretends or feigns.

Aft

- (a) Always remembered.
- (b) A spar or mast.
- (c) Often.
- (d) Apt or efficient.

Agglomerant

- (a) A substance causing the particles of a mixture to form lumps.
- (b) A person with defective speech.
- (c) Pungent.
- (d) An abbreviated address.

Ahead

- (a) To cut off the head of anything
- (b) The second of a series.
- (c) To outdistance.
- (d) At the head.

Air

- (a) Carbon dioxide.
- (b) The atmosphere.
- (c) A small shrub found in Asia.
- (d) A weapon used by aborigines.

Air-tight

- (a) Not allowing air to pass.
- (b) Not permeable to any gas.
- (c) Air charged with ammonium.
- (d) Provided with a cover.

Alder

- (a) A fool.
- (b) Older.
- (c) Egg sampler.
- (d) Separation of whey from milk.

All

- (a) In complete or highest degree.
- (b) A shoemaker's instrument for punching small holes.
- (c) A canoe in use on the Great Lakes.
- (d) To produce astonishment.

Alternate

- (a) One chosen to act in the place of another.
- (b) A colleague.
- (c) To provide amusement.
- (d) One who falsifies.

Amalgamable

- (a) That which may be likened to another thing.
- (b) Capable of being mixed or compounded.
- (c) Loveable.
- (d) Without manifestation.

Americanism

- (a) Any animal native to America.
- (b) The habits or customs of North American Indians.
- (c) The fauna of the Western Hemisphere.
- (d) A word or phrase peculiar to the people of the United States.

Amorrow

- (a) Before the morrow.
- (b) On the morrow.
- (c) After the morrow.
- (d) To mortify.

Analog

- (a) A compendium of words and phrases.
- (b) A term similar to, or resembling.
- (c) An unlike term.
- (d) A supplementary list.

Ancestral

- (a) Having to do with a later type.
- (b) Without regard to precedent.
- (c) Pertaining to an earlier type.
- (d) Pertaining to blood relationship.

Anemometer

- (a) One who speaks profusely.
- (b) An instrument for measuring the force or velocity of wind.
- (c) An officer sent to plead compromise.
- (d) A measure of liquid pressure.

Angler

- (a) One who fishes with rod, line, and hook.
- (b) One who pretends.
- (c) The steersman of a scow.
- (d) A pitcher of curves.

Anti

- (a) A descent.
- (b) Before.
- (c) A bringer of ill tidings.
- (d) One opposed to any proposed or enacted policy.

Antiparallel

- (a) A straight line and a curved line side by side.
- (b) A perpendicular line or surface connecting two parallel lines or surfaces.
- (c) One of two or more lines or surfaces making equal angles with two others, taken in contrary order.
- (d) The projection of a curved surface upon a plane surface.

Anxious

- (a) Extremely joyful.
- (b) Subject to painful or disturbing suspense.
- (c) Without forethought.
- (d) In a provoking manner.

Apices

- (a) A form of Greek architecture.
- (b) Plural of apex.
- (c) A small temple.
- (d) A species of finch.

Apprehensive

- (a) Thoughtful.
- (b) Pertaining to laziness.
- (c) Anticipative of evil.
- (d) Capable of understanding.

Aqueous

- (a) Compounded with acid.
- (b) Watery.
- (c) Airy.
- (d) Having to do with the brain.

Architecture

- (a) The art of designing and constructing buildings.
- (b) One who plans and designs buildings.
- (c) A landscape gardener.
- (d) Having a beautiful contour.

Areach

- (a) Coupling of a wagon.
- (b) Noise made by a double reed whistle.
- (c) To jump.
- (d) Extend.

Arm

- (a) To provide with food.
- (b) A small animal similar to the lemur.
- (c) A tendency to swoon.
- (d) Any weapon.

Arrant

- (a) Victorious.
- (b) Notoriously bad.
- (c) One who pilfers.
- (d) Playing the part of a dandy.

Artful

- (a) Characterized by cunning.
- (b) Beautiful or shapely.
- (c) Having a desire to paint or sketch.
- (d) Quick of movement.

Associate

- (a) A kind of iron ore.
- (b) Having a metallic lustre.
- (c) Pertaining to sedition.
- (d) United.

Atom

- (a) A contraction of "At Home."
- (b) One of the hypothetical indivisible parts of which all matter is supposed to be formed.
- (c) A small camera.
- (d) A primitive cell.

Attorney-general

- (a) The chief law officer of a government.
- (b) The officer second in command of an army.
- (c) The attorney for a general in a law suit.
- (d) A judge of the supreme court.

Augury

- (a) The process of boring holes.
- (b) Intensification.
- (c) The art of foretelling by signs or omens.
- (d) Having to do with the ear.

Authorized

- (a) Formally sanctioned.
- (b) Composed by an author of repute.
- (c) Prohibited or prevented from action.
- (d) Written with accuracy.

Ave

- (a) Evening.
- (b) State of being tired.
- (c) Sweet or gentle.
- (d) A word of salutation.

Avow

- (a) To use profanity.
- (b) An evergreen tree found in central America.
- (c) To promise.
- (d) To nullify.

Backwoods

- (a) A species of oak.
- (b) Any rural and uncultivated region.
- (c) Fallow land lying beside a forest.
- (d) The inner portion of a forest.

Bailee

- (a) A dipper used for dipping water from a boat.
- (b) A Hawaiian land-toboggan.
- (c) One who receives certain personal property in trust to perform some act in respect to it.
- (d) A species of salt-water tortoise found in southern waters.

Bale

- (a) To dip water from a boat.
- (b) That which causes ruin or sorrow.
- (c) Security given in order that a person may be set free.
- (d) A decision.

Balsamous

- (a) Having the qualities of balsam.
- (b) A kind of petrified wood found in certain sections of North America.
- (c) Gentle and soothing.
- (d) Said of lumber of a loose texture.

Bar

- (a) An honest fellow.
- (b) A C. G. S. unit of atmospheric pressure.
- (c) Bread made by fermentation.
- (d) A punch for making four or more holes in paper.

Bargained

- (a) Borrowed.
- (b) Sold at below cost.
- (c) Negotiated.
- (d) Brought on a barge.

Baronetage

- (a) The income derived by a baron from his lands and vassals.
- (b) The rank or state of a baronet.
- (c) A long reed musical instrument with seven keys.
- (d) A crown of the same height all around.

Baseball

- (a) A black ball.
- (b) An evil fellow.
- (c) A marker used to show the destination for a foot race.
- (d) A game played with bat and ball, named from the four bases which mark the course each runner must take.

Bassoon

- (a) A stick fashioned for the use of police.
- (b) A wooden reed-instrument with curved mouth-piece.
- (c) The lowest line on a musical staff.
- (d) To fasten by means of brads.

Battening

- (a) The putting on of scantlings.
- (b) Damming a river by building from both sides toward the center.
- (c) To strike a ball with a bat.
- (d) Acting foolishly, like a bat.

Baubling

- (a) Paltry.
- (b) Dreamily speaking.
- (c) Disconnected discourse.
- (d) Sounds like those coming from hollow vessels.

Bear

- (a) To hide in a snow drift.
- (b) To uncover.
- (c) A dust explosion.
- (d) To force down the price of.

Beechen

- (a) To turn white by exposure.
- (b) A small deformed bee.
- (c) Pertaining to the beech-tree.
- (d) Whining like a dog.

Beholden

- (a) Contained in a measure.
- (b) To keep an object that is not prized.
- (c) Held under obligation.
- (d) Trumpery.

Bellmouth

- (a) A large South American moth.
- (b) Hilarious.
- (c) To shape at the mouth or muzzle like a bell.
- (d) Lucky coin.

Benefice

- (a) Soft mush-ice.
- (b) An ecclesiastical living or preferment.
- (c) A cheerful face.
- (d) A weight to help lower a diver.

Bereave

- (a) To deprive.
- (b) To bind with hoops.
- (c) A brace in cast iron.
- (d) Short of breath.

Best

- (a) Mold in which brass castings are made.
- (b) A polishing brush.
- (c) Fine sand to pack in with coarse gravel.
- (d) The most excellent thing.

Billing

- (a) Two pendulums swinging in unison.
- (b) Cording pig iron in sacks.
- (c) Putting weights in order.
- (d) The act of making out a bill.

Black

- (a) Having little or no power to reflect light.
- (b) A sinner.
- (c) Chimney choking with smoke.
- (d) Over-indulgence.

Blame

- (a) Short arm on a mast.
- (b) Indigestible food.
- (c) Support for a stone.
- (d) The act of censuring.

Blamished

- (a) Censured.
- (b) Rough surfacing of a file.
- (c) Cut off abruptly.
- (d) A hopeless saint.

Block

- (a) Fulcrum end of a lever.
- (b) A dull feeling over the eyes.
- (c) That which hinders or obstructs.
- (d) A sign in musical composition.

Blubber

- (a) A boy with large eyes and small mouth.
- (b) Broad band running half-way around a coat.
- (c) Strong.
- (d) The layer of oil-yielding fat beneath the skin in cetaceans.

Bolt

- (a) A nearly horizontal cylinder covered with silk or other fabric for separating the flour of wheat from the hull or bran.
- (b) The large end of a pear.
- (c) The largest man in a crowd.
- (d) Husks of nuts, fruits, grain, etc.

Bone-cartilage

- (a) Old bones that are used in the manufacture of fertilizers.
- (b) Cars used for hauling refuse.
- (c) A paste made from animal glue.
- (d) The gelatinous matrix left after dissolving out the calcium salt of bone with dilute acid.

Brachia

- (a) Upper part of wind-pipe.
- (b) The weight on a pile driver.
- (c) Processes resembling arms.
- (d) Gases arising from stagnant water.

Bran

- (a) Marking with a hot iron.
- (b) To borrow.
- (c) To reduce to scrap.
- (d) The crow.

Breacher

- (a) A breaker.
- (b) The hip part of a horse's harness.
- (c) A cheap detective.
- (d) The large rope with which a vessel is tied.

Breathable

- (a) A board on which bread is displayed.
- (b) Fit to breathe.
- (c) A husky sound or voice.
- (d) Broad-minded religiously.

Bridgewater

- (a) Water lying under a bridge.
- (b) A broadcloth once manufactured at Bridgewater, England.
- (c) Tears shed at the loss of a game of cards.
- (d) A beverage made of oatmeal and water.

Brood

- (a) Blood-clot.
- (b) Hard-baked stale bread.
- (c) Having young.
- (d) A course heavy cloth.

Brush

- (a) Twelve logs fastened together in a raft.
- (b) The front seat in an open boat.
- (c) To touch with a light stroking movement.
- (d) To argue vehemently.

Buckish.

- (a) A rapid muscular activity.
- (b) Delightful.
- (c) A sharp, acrid taste.
- (d) Foppish.

Build

- (a) Form of construction.
- (b) A picture.
- (c) A broad substantial foundation.
- (d) A very narrow waist or corset.

Burden

- (a) A poisonous berry.
- (b) Something often repeated or dwelt upon.
- (c) The metal part of a loose-leaf binder.
- (d) The last hard piece of leather on a shoe heel.

Burro

- (a), A very small donkey.
- (b) The covering of a chestnut.
- (c) Lumps of rust on old iron.
- (d) A rough, stony path.

Bust

- (a), The human chest or breast.
- (b) Soiled with clay.
- (c) The pithy center of corn cobs.
- (d) The metal binders on smoking-pipes.

Butler

- (a) A designer of buttons.
- (b), A man servant who has charge of the dining-room, etc.
- (c) An expert bell founder.
- (d) A device for drawing liquors from casks into bottles.

By

- (a) To purchase.
- (b), Near.
- (c) Sleepiness.
- (d) A Japanese sweetheart.

Cable

- (a) To insult by laughing.
- (b) Profuse flow of saliva.
- (c), To send by submarine telegraph.
- (d) A nervous twitching of the lips.

Calf

- (a), The rounded prominence of the hinder part of the human leg, below the knee.
- (b) The crying of a large boy.
- (c) To tease.
- (d) The supporting timbers of a dormer-window.

Canage

- (a) This age in which so much canned goods is eaten.
- (b), A factory in which canned goods are made.
- (c) A bloody encounter.
- (d) Rent in kind.

Canopy

- (a) An overhanging screen or shelter.
- (b) A seat on which two can sit.
- (c) A pale pink precious stone.
- (d) A very soft, yet durable, tin.

Cartilage

- (a) Gristle.
- (b) A packing material made from the fibers of banana stalks.
- (c) Constant good nature.
- (d) The act of snubbing.

Cast-iron

- (a) A metallic boat.
- (b) Brittle.
- (c) Scroll forms for rock chiseling.
- (d) Made of cast iron.

Categorical

- (a) A howling noise.
- (b) An absolute proposition.
- (c) Fictitious.
- (d) A proposition to be proven.

Cathead

- (a) To open a wound by means of a rubber tube.
- (b) Excessive secretion by the kidneys.
- (c) A large round spotted bean.
- (d) To make fast to the capstan.

Cavil

- (a) To find fault with captiously.
- (b) To ring by means of a hammer.
- (c) Heavy breathing.
- (d) The small sharp lip on an auger.

Cella

- (a) A cavity.
- (b) A musical stringed instrument.
- (c) A small dish for spices.
- (d) A machine for forming chair seats.

Center

- (a) A mythological animal covered with feathers.
- (b) A gift booklet.
- (c) A needle for making holes in wax.
- (d) The middle.

Certification

- (a) Distinction.
- (b) Notification.
- (c) Arranging according to class.
- (d) Amelioration.

Chain

- (a) To tug fiercely.
- (b) A succession of events.
- (c) A variegated Indian blanket.
- (d) A string of interlinked rings or links.

Chameleon

- (a) To provide with fruit in season.
- (b) A poisonous mushroom.
- (c) A family of limicoline birds, including plovers.
- (d) An American anolidid or iguanid that has the power of changing its colors.

Charge-sheet

- (a) Daily register of charges and arrests against prisoners.
- (b) A monthly bill, or dun.
- (c) In an account book, a specification of merchandise bought on credit.
- (d) In printing, a corrected proof-sheet.

Chaste

- (a) The indentation at the butt of a knife blade.
- (b) To punish.
- (c) Virtuous.
- (d) A small owl found in Porto Rico.

Chiasm

- (a) An abyss.
- (b) A decussating or X-like commissure.
- (c) A nervous disease characterized by violent trembling.
- (d) An antelope found in Asia.

Chimerize

- (a) To make horrible.
- (b) To clothe a new-born babe.
- (c) Use discretion in judgment.
- (d) Entertain absurd fancies.

Chirpling

- (a) An ornamental carving on a dresser.
- (b) A U-shaped moulding.
- (c) A little chirper.
- (d) Producing a succession of sharp, quick sounds.

Chromosphere

- (a) A lens made of glass which contains chromium.
- (b) A relatively thin layer of incandescent red gas surrounding the sun.
- (c) An instrument for determining relative humidity.
- (d) A glass globe used by spiritualists in their profession.

Chuck

- (a) A river fish, similar to the salmon.
- (b) A sub-order of ctenoidians.
- (c) A short sudden noise.
- (d) Brittle.

Church

- (a) To preach.
- (b) A building dedicated to Christian worship.
- (c) A plow equipped with a colter.
- (d) To give alms.

Circumcision

- (a) Spiritual purification.
- (b) Encircling.
- (c) A wave of the voice embracing both a rise and a fall on the same syllable.
- (d) Act of undulating.

Citrous

- (a) Having a yellow color.
- (b) Having the qualities of citrine.
- (c) Pertaining to citrus.
- (d) Possessing acidity.

Clip

- (a) To name.
- (b) A dandified young man.
- (c) An appliance that grips.
- (d) A canter.

Coak

- (a) Word used to call horses.
- (b) An oxide of iron.
- (c) A coal from which the volatile constituents have been removed.
- (d) A fossil sea shell.

Cobby

- (a) Headstrong.
- (b) A cab-driver.
- (c) Spick and span.
- (d) Pilot of a barge.

Cochineal

- (a) A protoxide of barium.
- (b) A dyestuff made from certain insects.
- (c) In Great Britain, a second king at arms.
- (d) A Bohemian folk-dance.

Code

- (a) To make flattering remarks.
- (b) In music, the close of a composition.
- (c) A nuciferous tree of the West Indies.
- (d) Shoemakers' wax.

Cogger

- (a) A clevis.
- (b) One who makes gear-cogs.
- (c) A rustic, or miserly man.
- (d) One who shirks his duty.

Coin

- (a) A gift.
- (b) A supercilious youngster.
- (c) An inventor of words.
- (d) A piece of metal or alloy for use as money.

Colorable

- (a) That which may be colored.
- (b) To be regretted.
- (c) A genus typical of a certain family of crinoids.
- (d) Pertaining to an unruly mob.

Compart

- (a) Studded with nails.
- (b) Condensed.
- (c) Partition.
- (d) The forecastle of a vessel.

Compelled

- (a) Hindered.
- (b) Shaped like a fresh-water eel.
- (c) Involuntary.
- (d) Foppish.

Compositor

- (a) More compact.
- (b) One who instructs.
- (c) One who or that which angers another.
- (d) One who sets type.

Conception

- (a) A literary style overloaded with double meanings.
- (b) Apprehension of anything by the mind.
- (c) Capable of perception.
- (d) An analogous term.

Confidential

- (a) Private, or trusting.
- (b) Pertaining to a meeting for deliberation.
- (c) Having great influence.
- (d) A form of sonnet used by early writers.

Congratulation

- (a) Punishment unjustly inflicted.
- (b) A resemblance.
- (c) Being confined to certain limits
- (d) Complimentary expression of sympathetic satisfaction.

Connivent

- (a) Diverging.
- (b) Converging or coming into contact.
- (c) Part of a circumference.
- (d) A circle in juxtaposition to two parallel lines.

Consist

- (a) To withhold.
- (b) To be composed or constituted.
- (c) To continue firmly or steadily in any course undertaken.
- (d) Part of a ship's mast.

Weel

- (a) A fish-trap made of twigs and rushes.
- (b) A shrub bearing edible red berries.
- (c) A sea duck sought for its down.
- (d) A donkey.

Weight

- (a) Buoyancy.
- (b) Downward pressure due to gravity.
- (c) A point or horn.
- (d) To postpone action.

Wheatear

- (a) A tear shed in anger.
- (b) A furze-bush.
- (c) A bird found in northern lands.
- (d) The rice-bird.

White

- (a) Having a light shade or color.
- (b) Absence of light.
- (c) Lovely.
- (d) To shave closely.

Will

- (a) Any striped cat.
- (b) To exercise the faculty of volition.
- (c) A trail.
- (d) Vagrant.

Wind

- (a) To stamp.
- (b) Flight.
- (c) A current of air.
- (d) To shrink.

Woodcut

- (a) Corded wood.
- (b) An animal closely allied to the groundhog.
- (c) A road through a dense forest.
- (d) A wood-engraving.

Word-coinage

- (a) Slang.
- (b) The practice of inventing words for special occasions.
- (c) Classification of words.
- (d) State of being precise in speech.

Workless

- (a) Useless.
- (b) Female beetle.
- (c) Wife of an Ethiopion army officer.
- (d) Having no work.

Wreckage

- (a) Infusion of malt before fermentation.
- (b) Material from a wreck.
- (c) A twisting or sprain.
- (d) Act of preventing the transmission of a cablegram.

Yell

- (a) Xanthine.
- (b) A sharp, loud, inarticulate cry.
- (c) To expostulate.
- (d) Proverbial.

Zincous

- (a) Soft.
- (b) Pertaining to zinc.
- (c) Impudent.
- (d) An etching on a zinc plate.

Zootic

- (a) In confusion.
- (b) Pertaining to the zoo.
- (c) Containing evidences of former life.
- (d) Hallelujah.

KEY TO LABORATORY TEST SHEET A.

Aabec (c); absolute (c); accidental (d); actio (d); addressee (a); adjust (c); adroit (a); affect (b); aft (c); agglomerant (a); ahead (d); air (b); air-tight (a); alder (b); all (a); alternate (a); amalgamable (b); Americanism (d); amorrow (b); analog (b); ancestral (c); anemometer (b); angler (a); anti (d); antiparallel (c); anxious (b); apices (b); apprehensive (c); aqueous (b); architecture (a); areach (d); arm (d); arrant (b); artful (a); associate (d); atom (b); attorney-general (a); augury (c); authorized (a); ave (d); avow (c); Backwoods (b); bailee (c); bale (b); balsamous (a); bar (b); bargained (c); baronetage (b); baseball (d); bassoon (b); battening (a); baubling (a); bear (d); beechen (c); beholden (c); bellmouth (c); benefice (b); bereave (a); best (d); billing (d); black (a); blame (d); blemished (c); block (c); blubber (d); bolt (a); bone-cartilage (d); brachia (c); bran (d); breacher (a); breathable (b); bridgewater (b); brood (c); brush (c); buckish (d); build (a); burden (b); burro (a); bust (a); butler (b); by (b); Cable (c); calf (a); canage (d); canopy (a); cartilage (a); cast-iron (d); categorical (b); cathead (d); cavil (a); cella (a); center (d); certification (b); chain (d); chameleon (d); charge-sheet (a); chaste (c); chiasm (b); chimerize (d); chirpling (c); chromosphere (b); chuck (b); church (b); circumcision (a); citrous (c); clip (c); coak (c); cobby (a); cochineal (b); code (d); cogger (b); coin (d); colorable (a); compart (c); compelled (c); compositor (d); conception (b); conferential (b); congratulation (d); connivent (b); consist (b); constriction (d); continental (a); contralto (d); contribution (d); conviction (d); corn (a); corosif (c); countenance (a); coupled (d); cow (a); crank (d); creditability (a); crib (c); croche (b); cross (a); cruciferous (b); crystalliform (d); cupboard (c); current (b); customance (b); Da capo (a); daub (c); debate (d); decagon (b); declare (b); deeducational (d); deformation (a); deleble (a); demagogic (b); despite (b); desulphurize (c); diamond (d); dibasic (b); die (d); diminish (b); directness (a); discarnate (c); disclamation (c); diseased (c); dismayed (a); distinctive (b); diversiflorous (b); dock (d); dolphinet (a); double (d); downward (b); dressmaker (b); drone (a); dry (a); dunness (a); dyspepsia (c); Ear (b); earth (c); eccentric (c); educated (a); electricize (d); element (a); elk (c); embrace (c); enclad (c); engineered (b); enough (c); entity (b); equational (d); err (d); estate (b); ethize (d); every-day (d); executioner (a); expiatory (d); extrinsic (b); Fable (b); fag (d); fall (a); fanciless (d); feathering (d); fellow-servant (d); ferment (a); fetch (b); fictitious (b); figurative (c); filose (c); finn (a); firedrake (a); fish (b); flag (a); flat (a); fleshen (b); floatingly (d); flowerage (c); flush (c); focusing (c); foraminifera (d); forefeel (d); form (d); fortify (b); Friday (c); frondivorous (c); functional (c); Garnet (b); gastronomic (d); gear (a); general (a); genty (b); george (a); ginger (c); glycerin (c); goatee (d); goggle (c); goldenback (b); good (c); goshawk (a); graine (b); granule (c); grass (a); grayback (d); greenable (b); grog (c); gross (b); grudge (d); gulfed (b); gun-reach (b); gymnospermae (a); Hammer (c); handless (b); hand-nut (c); harbored (c); harmonical (a); harvester (d); hazer (b); heart (b); helmeted (a); hemic (c); hemispheric (d); heretical (d); hierarchy (c); holler (c); honorable (d); horse-tamer (b); house (c); humilant (d); hymnology (d); hypnotize (d); Ice (a); icy (c); idolater (a); imaginational (b); impaction (c); improporation (a); inaugural (d); includible

LABORATORY TEST SHEET B.

Give a working definition for each of the following words with which you are familiar:

Abbozzo
 Abderian
 Ablegate
 Acadialite
 Acemetic
 Acinaces
 Acroke
 Acuate
 Aedacula
 Agraph
 Albaras
 Algesia
 Allomorphite
 Almemar
 Amelification
 Ametropia
 Ampycidae
 Anisocnemic
 Anomatheca
 Antennaria
 Anthrax
 Aposthia
 Applanation
 Arca
 Argentamid
 Arundo
 Ash-cat
 Asplenium
 Astragalocalcaneum
 Athanatism
 Atrichiidae
 Austrium
 Ayme
 Babul
 Bagaty
 Banie
 Daya
 Beauvais's disease
 Bezique
 Becessis
 Biduous
 Biradial
 Bischofite
 B'nai B'rith
 Boeotian
 Boongary
 Boschveld
 Boucherism
 Bowdlerize
 Breeding
 Briza
 Bulnbuln
 Cadus

Calata
 Calocub
 Cameloidea
 Canin
 Cantharic
 Capischolus
 Capulincillo
 Carcinoma
 Carinate
 Carper
 Casern
 Cataphract
 Caucho
 Cerasite
 Chanterelle
 Charadriidae
 Checkle
 Chermes
 Choil
 Chorionitis
 Cinchonales
 Claribella
 Clavo
 Clepe
 Cloue
 Colchicum
 Colletic
 Comatula
 Commandancia
 Commoration
 Cond
 Copaiye-wood
 Coral-tree
 Corsie
 Cotgare
 Craiget
 Cuitikins
 Cumming
 Cyclamose
 Cyperus

Mulet	Quadrumanous
Myristicivorous	Quitantie
Nacarat	Radiobe
Nanmu	Rammelsbergite
Nark	Raoulia
Nasion	Ree
Naukar	Regnarok
Neo-Pythagorean	Reps
Neurula	Residencia
Niblick	Respondentia
Nither	Rhyparia
Noeggerathia	Rockweed
Noningerence	Roseolae
Nuciferous	Roxy
Obumbrant	Russium
Odize	Sabeca
Oecological	Sacrosanct
Ogee	Saintpaulia
Oilet	Salpicon
Olinia	Samech
Oolak	Santon
Ophileta	Sargo
Opsonin	Saxhorn
Oreodontidae	Schisma
Organacidia	Schoenus
Ortygan	Scirenga
Ouf	Scorkle
Oxytone	Scronach
Paleophysiology	Sealwort
Palmetum	Septuncial
Pancoline	Seu
Panotype	Shealing
Paradenitis	She-sole
Paresoanalgesia	Signa
Paroissien	Sinophile
Patrice	Skiamachy
Paviser	Snucks
Pentatrematoid	Somatology
Pepinillo	Sopsavine
Peregrinate	Sparpil
Pesade	Sphaerosiderite
Petronel	Spike-team
Pharaon	Stanhope
Phlogogenous	Staumrel
Phorometer	Steem
Phosphoryl	Stephoidea
Phronetal	Stibonium
Physiotype	Stomacephalus
Pilocystic	Sturnidae
Pisum	Subelaphine
Pleiad	Succedaneous
Poffle	Suffumige
Polyphonism	Superoccipital
Posticum	Swallowwort
Poundal	Swinge
Praetergum	Synaptase
Preabdomen	Syntypic
Propositum	Tenebrio
Protactic	Terebra
Prototypal	Tetradon
Pseudoscorpiones	Thallome
Pteropaedes	Thienone
Pundigrion	Tilefish
Pursuivant	Tolosa-wood
Pylorus	Tonsure

Tyrociny
Ululant
Uncharnel
Venust
Veronal
Vicontiel
Vincetoxicum
Vitelophag

Volapuk
Vorticidae
Wanigan
Warnestore
Weapon-salve
Wergild
Whincow
Whudder
Winebergite
Wireangle
Woaded
Wype
Yaip
Yorker
Zapote

For definitions to the above list see Funk and Wagnalls New Standard Dictionary of the English Language, 1916.

LABORATORY TEST SHEET C.

The following list represents one hundred words arranged in order of difficulty as determined by the test sheets used at Colorado College:

- | | |
|--------------------|-------------------|
| 1. adjust | 42. anti |
| 2. consist | 43. functional |
| 3. tradition | 44. fabler |
| 4. authorized | 45. jointage |
| 5. unobserving | 46. puma |
| 6. tumble | 47. apprehensive |
| 7. bereave | 48. memorative |
| 8. sham | 49. disclamation |
| 9. sensitive | 50. woodcut |
| 10. wreckage | 51. deeducational |
| 11. associate | 52. inebriate |
| 12. harbored | 53. anemometer |
| 13. surmise | 54. radial |
| 14. intimidation | 55. apices |
| 15. addressee | 56. expiatory |
| 16. artful | 57. contralto |
| 17. grudge | 58. jade |
| 18. drone | 59. nothingly |
| 19. stint | 60. extrinsic |
| 20. ahead | 61. tauten |
| 21. rate | 62. shunt |
| 22. urgency | 63. hierarchy |
| 23. perimeter | 64. forefeel |
| 24. deformation | 65. baronetage |
| 25. projectable | 66. dunness |
| 26. compelled | 67. lilyfy |
| 27. vault | 68. seditious |
| 28. adroit | 69. agglomerant |
| 29. peaceful | 70. battening |
| 30. desulphurize | 71. ave |
| 31. terse | 72. transitable |
| 32. augury | 73. creditability |
| 33. bone-cartilage | 74. analog |
| 34. specificity | 75. mavis |
| 35. semioval | 76. pennate |
| 36. initiator | 77. syllogistic |
| 37. surveyance | 78. cruciferous |
| 38. decagon | 79. categorical |
| 39. rueful | 80. baubling |
| 40. simultaneity | 81. goshawk |
| 41. mannikin | 82. chromosphere |

- | | |
|--------------------|------------------|
| 83. monodactyl | 92. nursedom |
| 84. processal | 93. octapody |
| 85. isochronize | 94. zootic |
| 86. prepended | 95. thermalgesia |
| 87. cella | 96. actio |
| 88. jujube | 97. canage |
| 89. diversiflorous | 98. graine |
| 90. loche | 99. spiritaly |
| 91. chimerize | 100. aabec |

It will readily be seen that the above list would be of very little value for testing any except college students and adults. A thoroughly adequate list of the nature of that suggested above would necessarily begin with the easiest words of infancy and would be applicable to any and all ages.
